My work in 2016 6-3

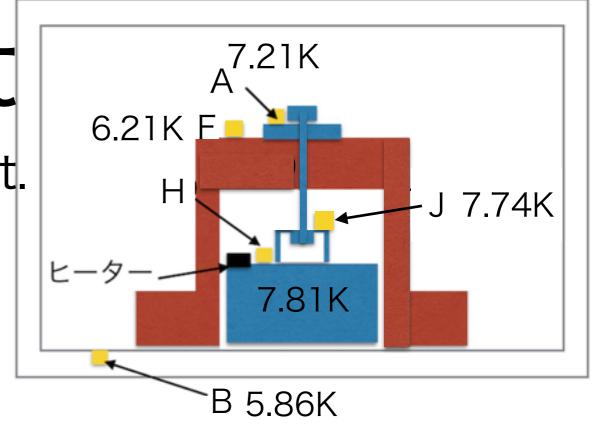

Hiroki Tanaka

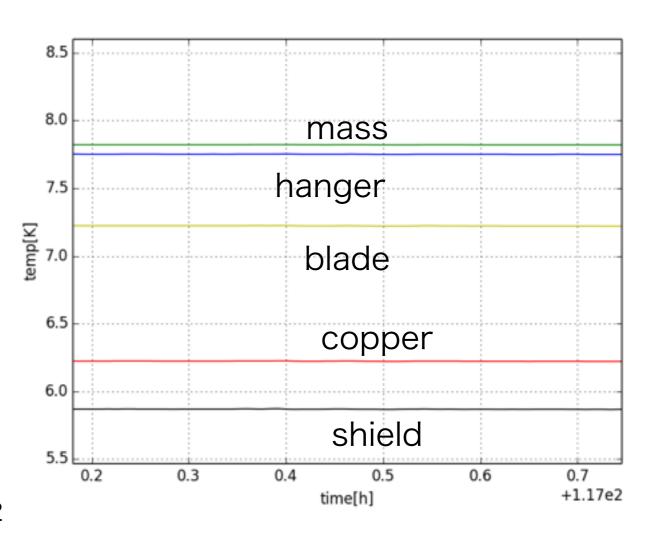

Heat load test

We cooled down the cryostat.

 $|dT_{A,F,H,J}/dt|<0.01 (K/h)$

heat load test (4th)

 \cdot $T_{\text{mass}} - T_{\text{copper}} = 1.6 \text{K}$

On the internet, I found the aluminium tape can prevent only 97% of the radiation (So 3% (about 25mW) goes through the tape).

heat load test(4th)

- · There is an "extra" heat load($P_{\text{extra}}(W)$).
- If I give the heater 0.25W, the real heat load is $0.25+P_{\text{extra}}(W)$.
- · 0.25+ $P_{\rm extra}$ is larger than 0.25, so if $T_{\rm mass}$ is low enough in this condition (P=0.25+ $P_{\rm extra}$), it means that $T_{\rm mass}$ is low enough when the real heat load is 0.25W, so it also means that bKAGRA requirement is satisfied.
- · So I started the heat load test.
- · I will show the result in the next meeting.

homework

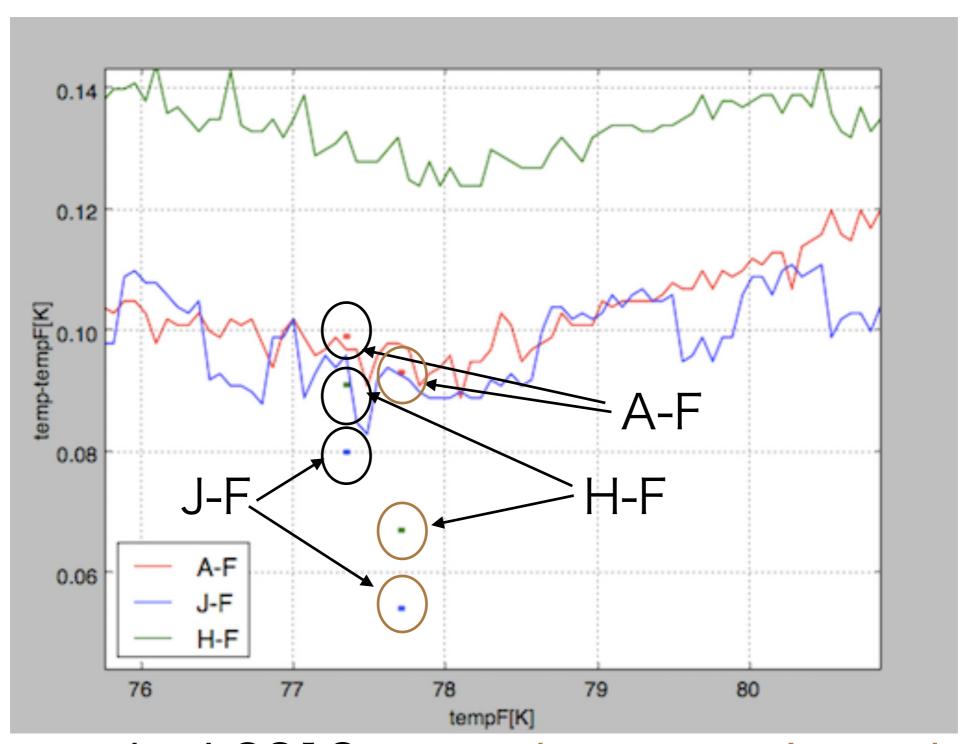

The temperature of sensor F should be 77.3K.

When I used the current supply and the multimeter, it was about 77.6K.

It was because I used the linear approximation.

I used the Chebyshev's polynomial.

homework

by LS218

by measuring voltage

Chebyshev's polynomial

 $T_{F}=77.35(K)$

            plt.grid()
            plt.show()
```

Future work

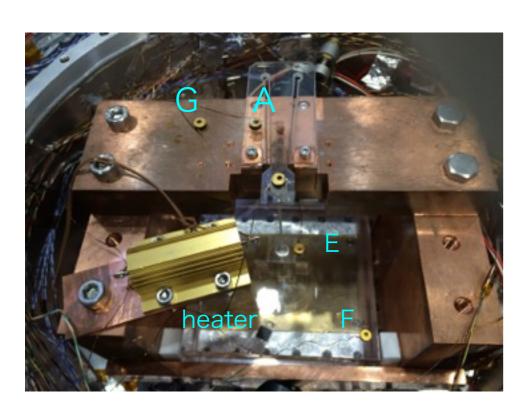

- We will finish the heat load test this week.
- After this test, we will start the Q measurement of one fiber prototype again.

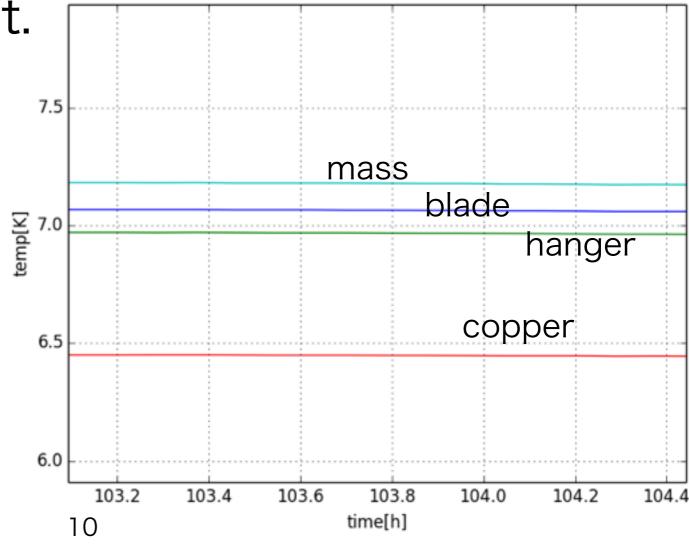

"previous" heat load test

After cooling down

*Calibration is incorrect.

heat load test (4th)

『断熱と遮熱の違い』

よく断熱と遮熱を同じように考える方がいますが、断熱と遮熱は違うものです。断熱は「対流」 「伝導」による熱移動に対して大変有効なものです。断熱材は空気の働きで熱の移動を遮断しま す。空気は熱伝導性が低い特性がある反面、対流を起こし熱を移動させる性質があります。断熱材 はじっとして動かない空気(静止空気)を使い、対流や伝導による熱の移動を遮断します。 対流による熱移動の例として、空気をたくさん含んだダウンジャケットは寒いスキー場でも体を 暖かく包んでくれます。

伝導の場合は、熱くなった鍋を空気を含んだ乾いたタ オル使って掴むことができます。ちなみに濡れたタオ ルで掴むとすぐさま熱くなり掴むことができません。 このように空気(静止空気)を利用した断熱材は対流 と伝導の熱移動に効果があります。

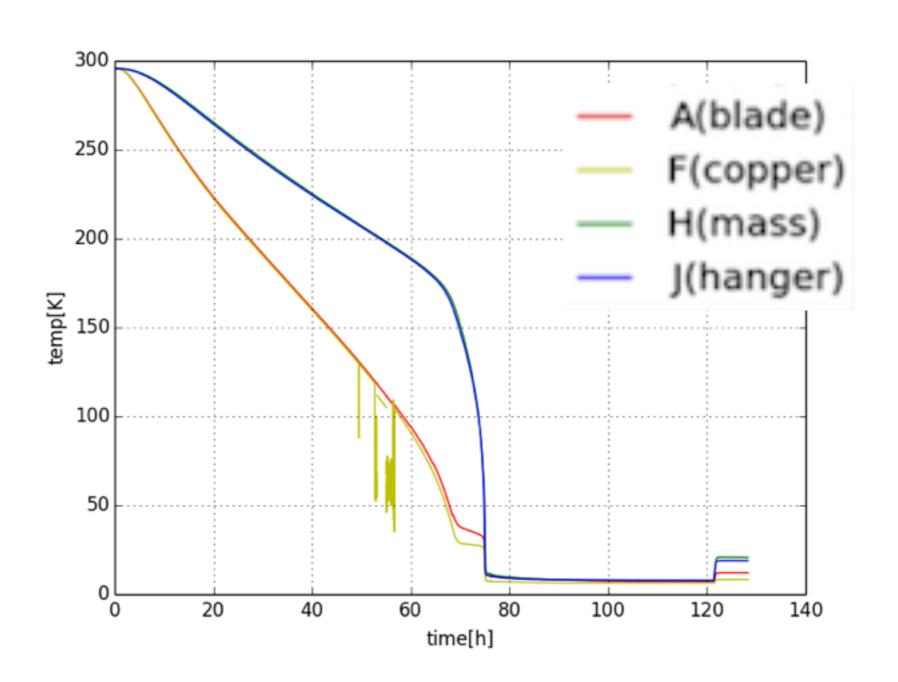

遮熱は「輻射」による熱移動に対して大きな効果があります。遮熱には金属幕を使用しますが、中でもアルミは輻射熱(電磁波)の反射に優れ、最大97%カットします。(一般の断熱材は反射率10%程度) 遮熱の

効果として太陽からの輻射熱の反射が最も期待されま

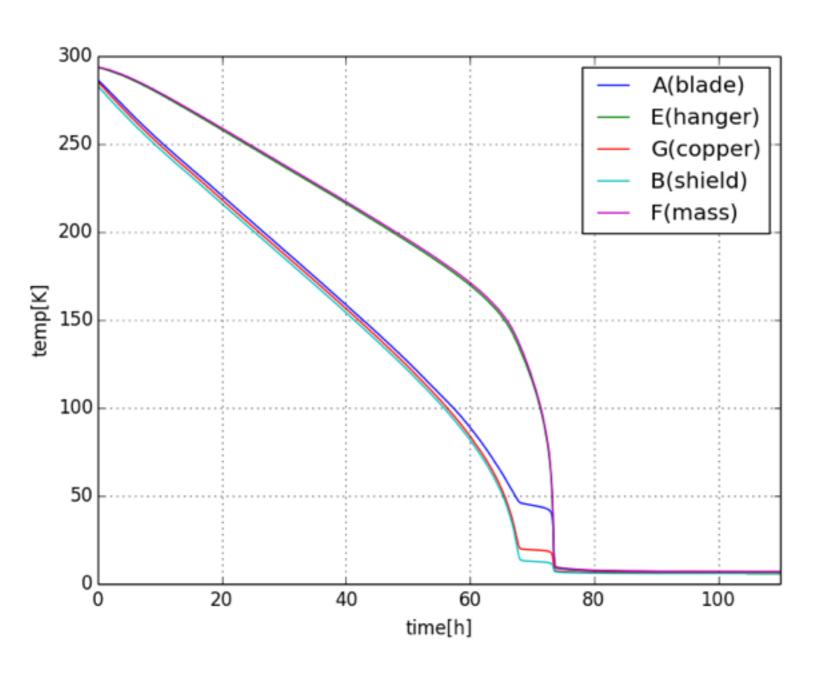

す。
