# Localization of coalescing binaries with a hierarchical network of gravitational wave detectors

Work report at APP Yoshinori Fujii

This work is mainly supported by Frederique Marion, Thomas Adams and MBTA team (especially in LAPP)

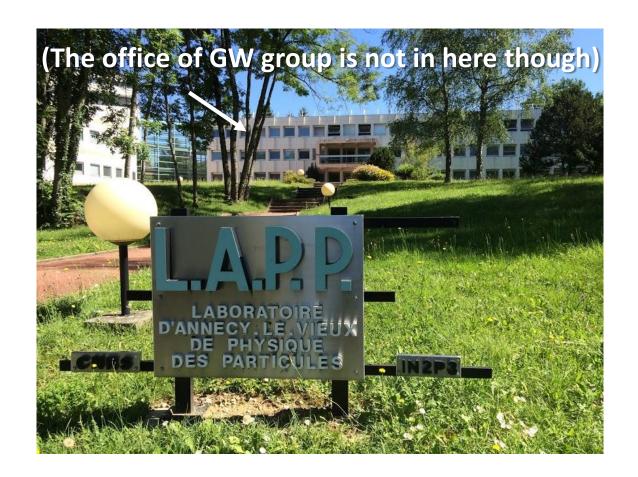

#### **Contents**

- 1. Introduction of LAPP and hierarchical search
- 2. GW-EM follow up pipe line for low-latency CBC search
- 3. Calculation setup
- 4. Optimization of Virgo threshold
- 5. Summary and KAGRA related topic

Introduction: GRAPP

#### Laboratoire d'Annecy-le-vieux de Physique des Particules

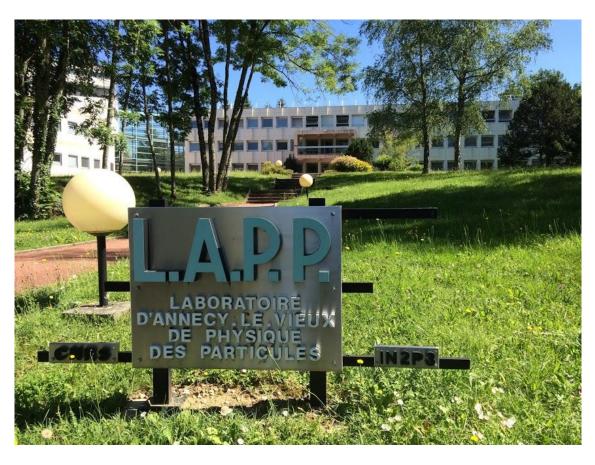

Development of low-latency search pipeline for CBC etc..

フランス

My work at LAPP was mainly about data analysis (not Vibration Isolation System)

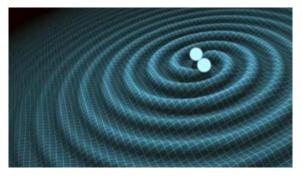

Introduction: GRAPP

#### Laboratoire d'Annecy-le-vieux de Physique des Particules

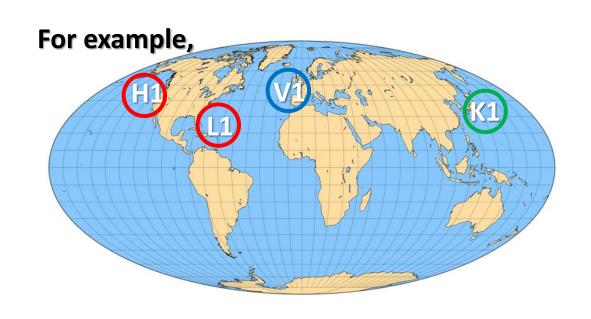

# Topic:

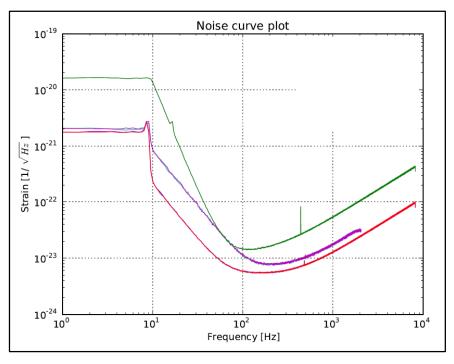

how newly constructed detectors should enter the detection network? (in low-latency CBC search)

#### **Introduction:**

Several detectors are needed for source localization (detection network)

The sensitivities of these detectors would be different from each other, especially just after their construction.

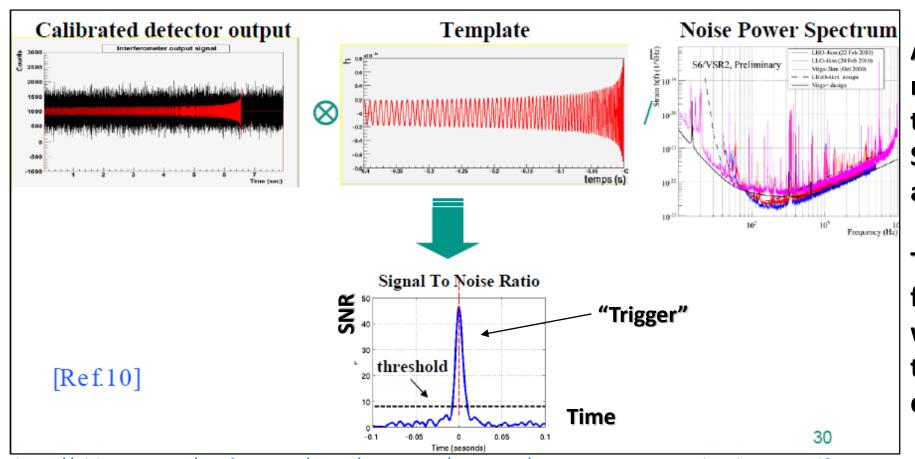

(ex. in observation 2 (O2), the higher sensitive 2 LIGOs, and the less sensitive Virgo)

In the Virgo or KAGRA, GW signals can be buried into noise easier than in LIGOs!

#### **Introduction:**

# **Especially, in the low-latency search for Compact Binary Coalescence (CBC)**

According to matched filtering, time series of Signal to Noise Ratio (SNR) are generated.

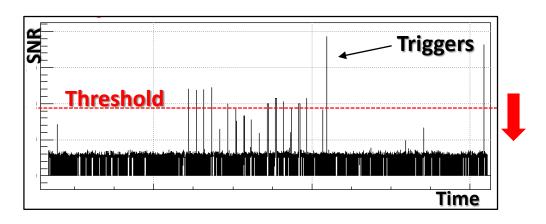

The generated SNR from less sensitive detectors whould be smaller than the SNR from high sensitive detectors.

http://old.apctp.org/conferences/2011/NRG2011/NRGPDF/CBC\_DA\_Korean\_School\_2011.pdf

The detection threshold SNR of less sensitive detectors are wanted to be lowered...

#### **Introduction:**

However, if the threshold SNR is purely lowered, we have to handle tons of the triggers

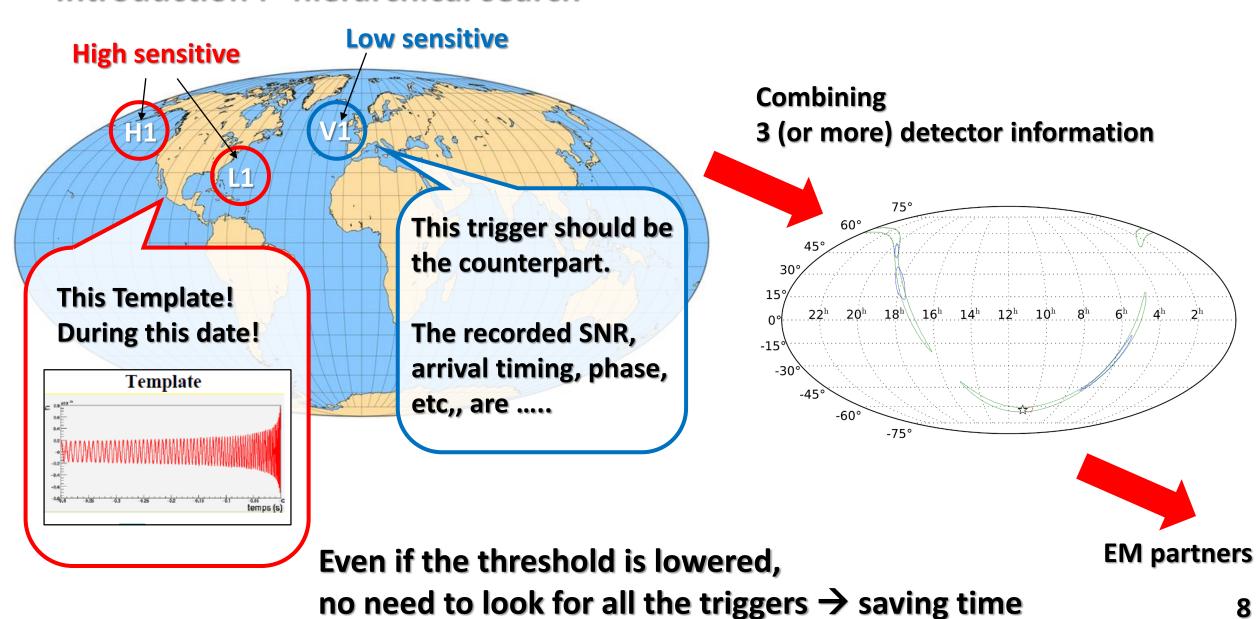

→ Computational cost and time cost get large.. Not low-latency, anymore!

How about including the less sensitive detectors into the network,

- 1. with lower threshold SNR than that of higher sensitive detectors, but
- 2. only when we search triggers, generated from higher sensitive detector's coincidences.

#### Introduction: "hierarchical search"

- 4. Identification of coincident triggers

•••

### **BAYES**ian TriAngulation and Rapid localization

Plot "sky map" from MBTA output information

#### Multi-Band Template Analysis (MBTA)

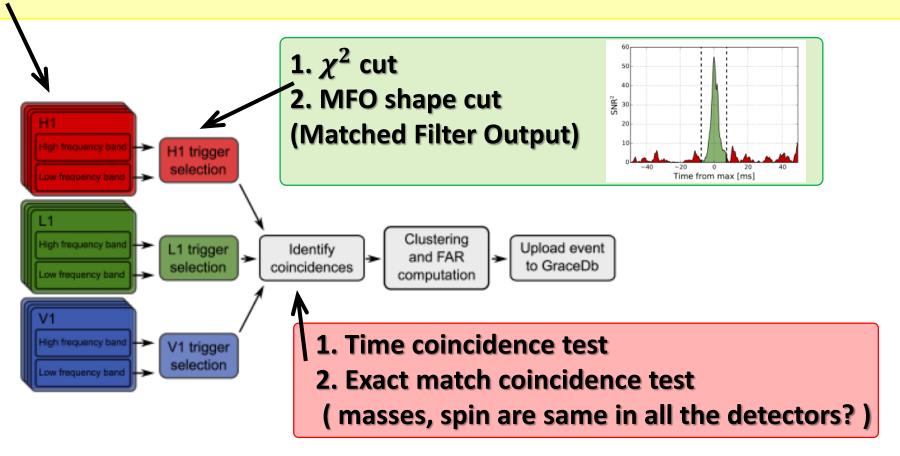

- → Split the matched filter across two (or more) frequency bands.
  - → Shorter templates in each frequency band
  - → Phase of the signal is tracked over fewer cycles.
  - → Smaller sampling rate for low frequency band

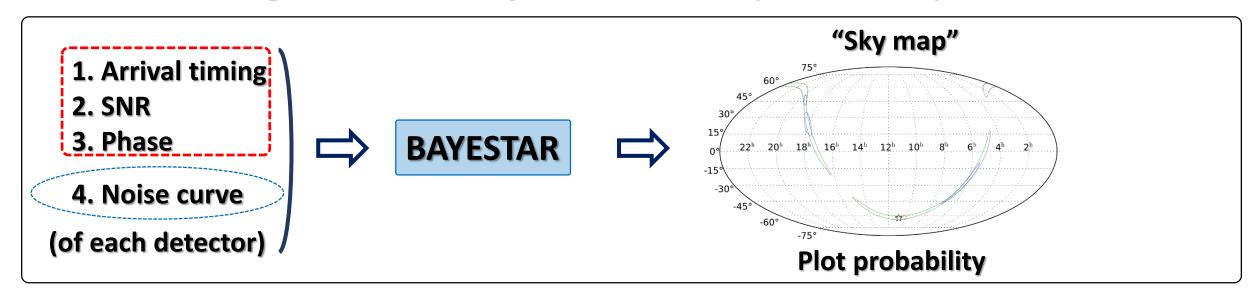

**Computational cost reduction** 

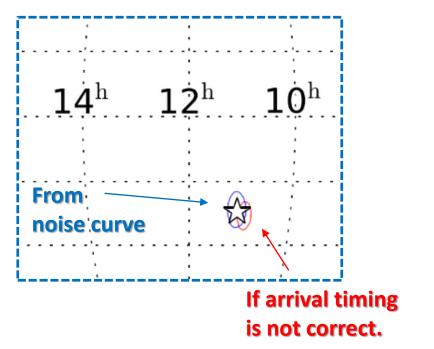

**FFT cost reduction** 

# **BAYES**ian TriAngulation and Rapid localization (BAYESTAR)

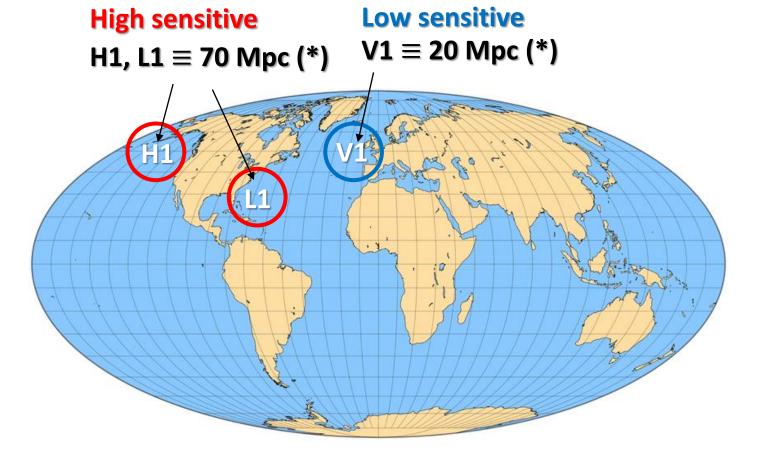

#### **Contents**

- 1. Introduction of hierarchical search

- 3. Purpose of this work
- 4. Calculation setup
- 5. Optimization of Virgo threshold
- 6. Summary and KAGRA related topic

# Purpose of this work: in the hierarchical search with HLV,

- 1. What is the optimal threshold for the V1?
- 2. How the localization gets improved at the threshold?

To answer these questions,

- 1) Prepare injection set
- 2) Suppose inputting them
- 3) Investigate re-constructed sky map

Measures of localization performance:

"Offset angle",
"Searched area"

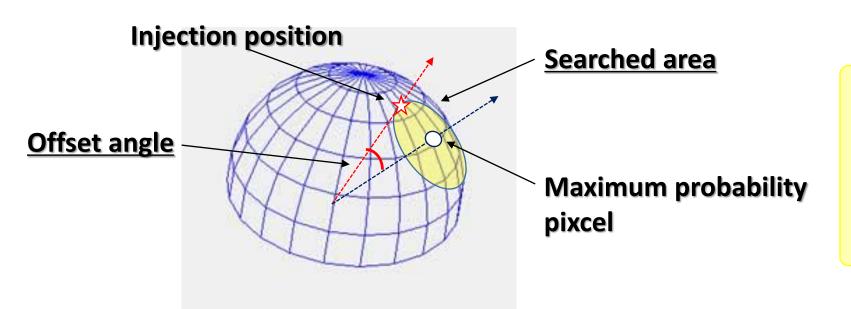

#### Definitions of the offset angle and the searched area:

#### 1. Offset angle:

Angle between the sky localization of the injected signal, and the reconstructed max probability pixel.

#### 2. Searched area:

The smallest area of the highest confidence region around the max probability pixel, to include the sky location of the injected signal.

#### Searched area

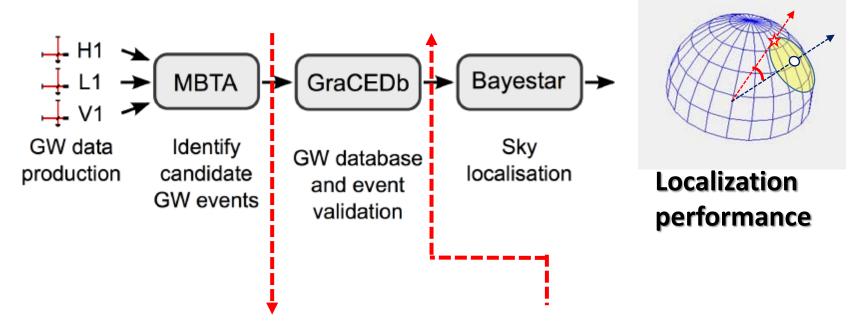

Ex. If the injected position is at a pixel of probability 0.7, the searched area is all the sum of the pixels which larger probability than 0.7.

- 4. Calculation setup
- 5. Optimization of Virgo threshold
- 6. Summary and KAGRA related topic

# **Calculation setup: Main flow**

#### 3. Re-construct sky map

How the localization gets improved?

#### 1. Prepare injection set

# Existed 248 MBTA outputs, obtained from HL double coincidences (generated from previous software - injection test)

#### 2. Suppose inputting them

Transform

HL → HLV triggers

adding artificial

V1 information

(SNR, timing, phase)

# Calculation setup: How to transform the triggers, HL $\rightarrow$ HL or HLV

#### **Considered 3 patterns:**

Case 1 var. : HL → HL or HL + random V

If p > FAP, otherwise

Suppose the V1 triggers from noises

**Worst case** 

Case2 :  $HL \rightarrow HL$ , or HL + V based on injection

If V1 SNR < threshold, otherwise

**Suppose the V1 triggers from signals** 

**Best case** 

Case 3 : HL → HL, or HL + random V, or HL + V based on injection

If p < FAP, If p > FAP and V1 SNR < threshold, If p > FAP and V1 SNR > threshold

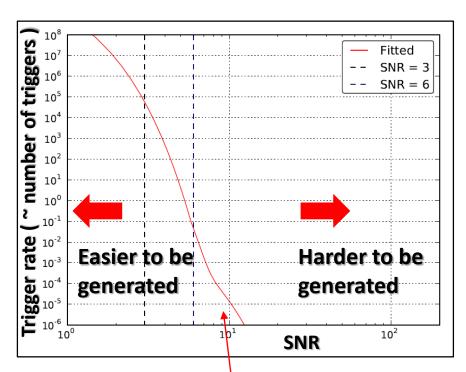

Suppose the V1 triggers from both of noises and signals

More realistic case

( How to generate the FAP, random V, V based on injection, is following )

# 1. "random V trigger: Vr"

1. SNR = Random above a threshold SNR, following measured O1 SNR distribution

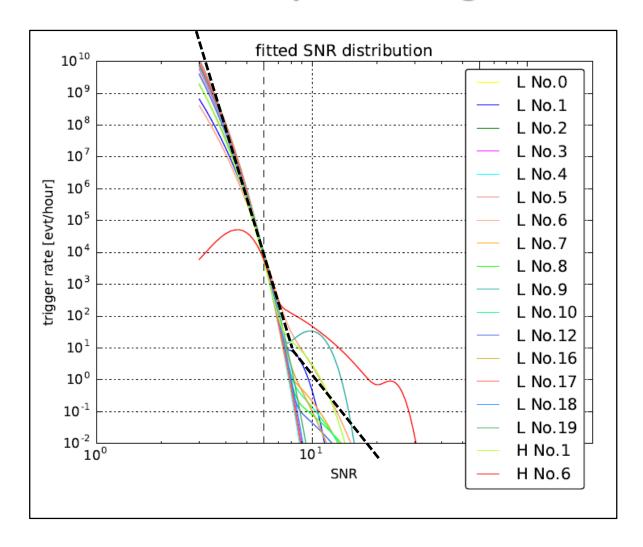

2. Timing =  $t_0 + \Delta t$ 

 $t_0 = t_{H1}$  if SNR<sub>H1</sub> > SNR<sub>L1</sub>, otherwise  $t_0 = t_{L1}$ .  $\Delta t =$  random uniform number from -35 ms to 35 ms.

3. Phase = random uniform number from 0 rad to 2  $\pi$  rad.

Obtained from O1 measurement ( next page )

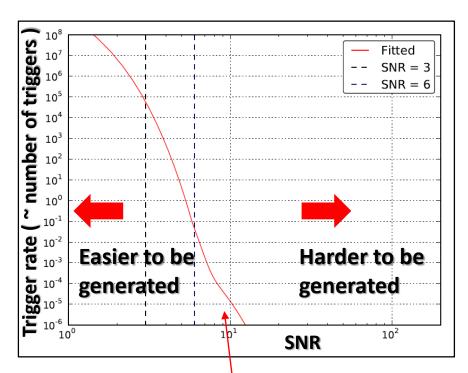

SNR distribution from ~ about 20 hours data → Choose typical curve

# 1. "random V trigger: Vr"

1. SNR = Random above a threshold SNR, following measured O1 SNR distribution

2. Timing =  $t_0 + \Delta t$ 

 $t_0 = t_{H1}$  if SNR<sub>H1</sub> > SNR<sub>L1</sub>, otherwise  $t_0 = t_{L1}$ .  $\Delta t = \text{random uniform number from -35 ms to 35 ms}$ .

3. Phase = random uniform number from 0 rad to 2  $\pi$  rad.

Obtained from O1 measurement ( next page )

# Calculation setup: False Alarm Probability (FAP)

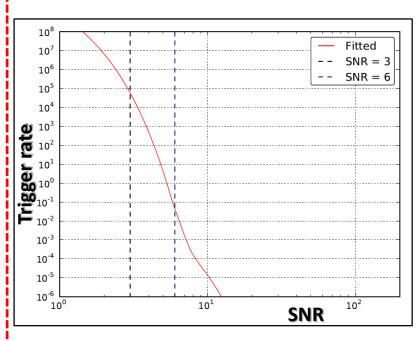

SNR distribution ( per template )

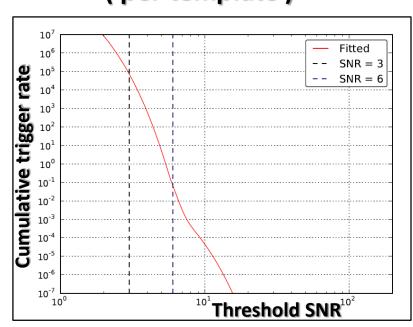

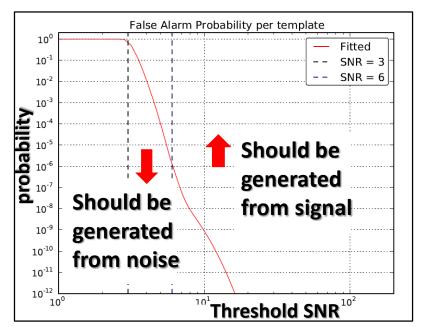

Cumulative SNR distribution ( per template )

False Alarm Probability ( per template )

$$FAP = 1 - \exp(-R \times T)$$

R = cumulative rate of background triggers per template, above a given threshold, per template,

T = analyzing time for the V1 (less sensitive detector) 4

. 70 ms for V1

# 2. "V based on injection: Vi"

1. 
$$SNR = SNR^{expected} + \Delta SNR$$

$$SNR^{expected} = from injection metadata$$

$$\Delta SNR = Gaussian(0, 1)$$

2. Timing = 
$$t^{\text{expected}} + \Delta t$$
  
 $t^{\text{expected}} = \text{injection meta data}$   
 $\Delta t = \text{Gaussian( 0, 1 ms )}$ 

3. Phase = 
$$\phi^{\text{expected}} + \Delta \phi$$

$$\phi^{\text{expected}} = \text{injection meta data}$$

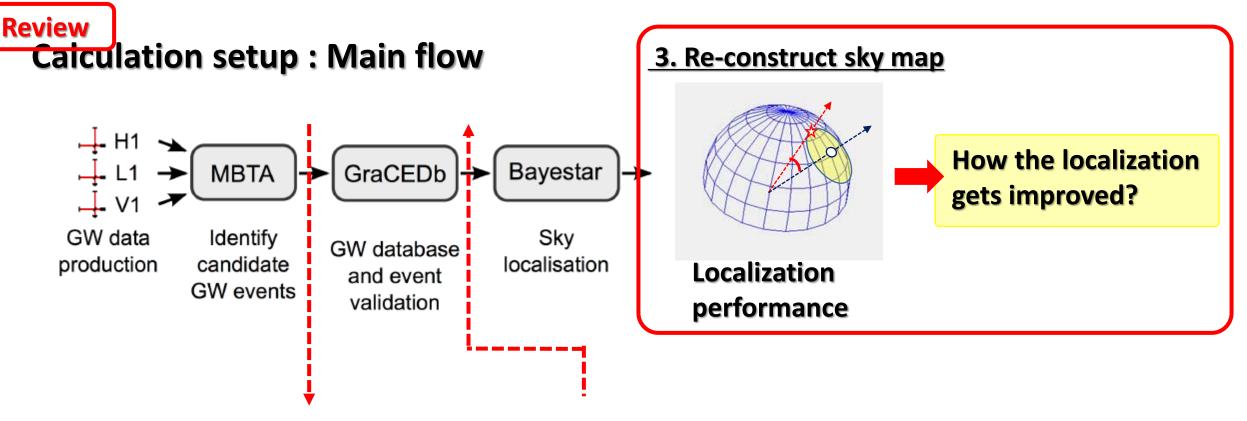

$$\Delta \phi = \text{Gaussian( 0, 0.25 rad )}$$

These uncertainties are added to simulate more from realistic performance.

The typical values are used.

#### **Contents**

#### **Typical result : sky map**

Offset angle

Offset (deg): Searched area (deg\*\*2)

Double coincidence 24.64 : 98.96

Triple coincidence 0.781 : 5.27

Repeat 248 times, and collect the statistics of the offset angle and the searched area

**Injection position** 

Searched

area

**Typical result : statistics** 

Offset angle

area

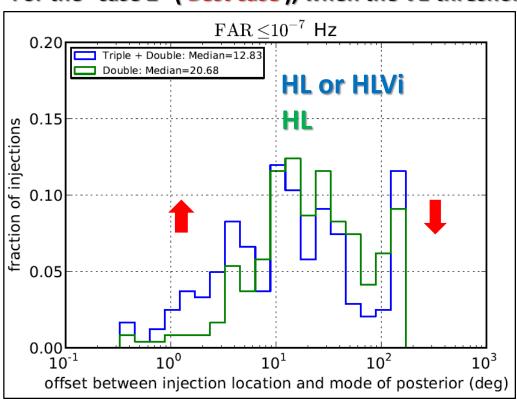

Searched

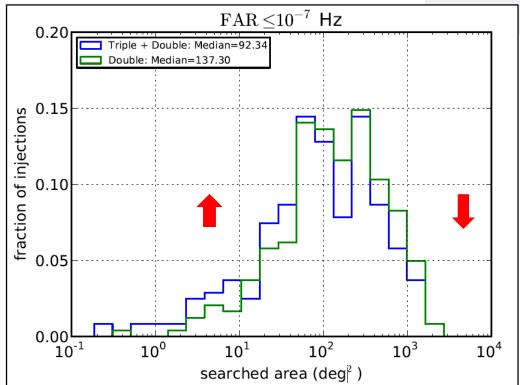

Maximum

probability

**Injection position** 

For the "case 2" ( Best case ), when the V1 threshold SNR is set at 3.0.

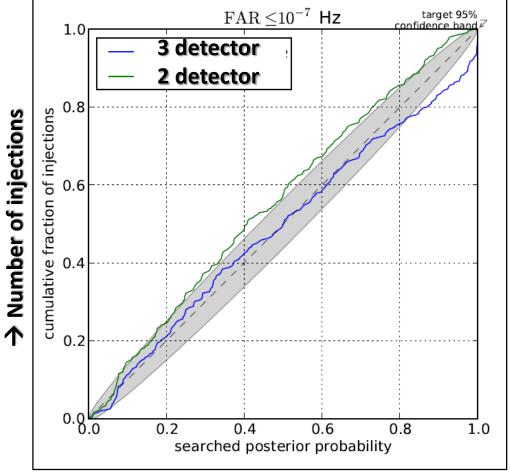

Offset angle

Searched area

Typical result : Self-consistency test

For the "case 2", V1 threshold SNR is set at 3.0.

→ Certain confidence area

→ Probability - Probability Plot :

90 % confidence area → 90% of injections should be included.

- → Localization depends on :
- 1. arrival timing difference
- 2. phase difference
- 3. relative SNR.
- → If the added uncertainties are properly, the curve should along with the diagonal line.

In this HLV search (blue), the curve gets below the diagonal line a little bit.

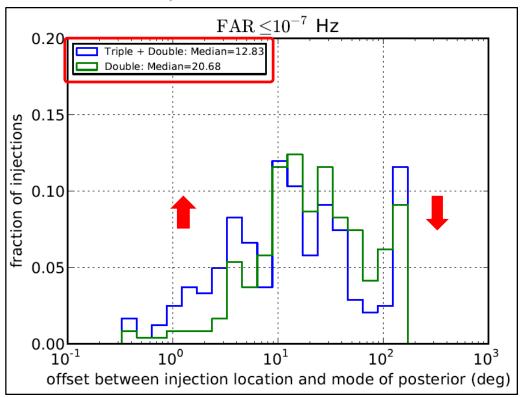

→ The added uncertainties are not crazy (though a little bit not realistic ).

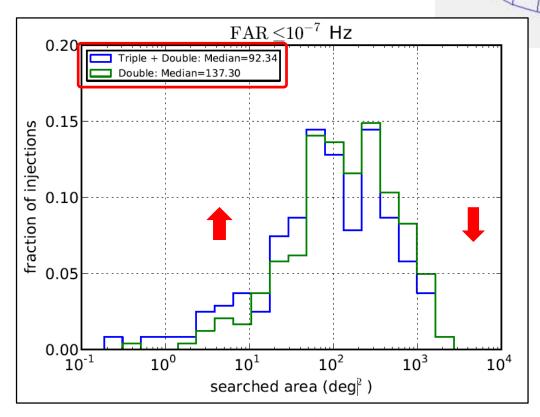

2. Timing = 
$$t^{\text{expected}} + \Delta t$$

$$\Delta t = \text{Gaussian( 0, 1 ms))} ----> 1 \text{ ms} \times \frac{6}{\text{V1 SNR}} \text{ etc. ?}$$

#### **Typical result : statistics**

For the "case 2", V1 threshold SNR is set at 3.0.

Offset angle

# Is the optimal threshold still valid for the noisy case?

#### **SNR distribution**

What is happen if noisier SNR distribution, FAP are used?

# Calculation setup: How to transform the triggers, HL $\rightarrow$ HLV

#### **Changed points:**

```
Case 1 var. : HL \rightarrow HL or HL + random V (Worst case)

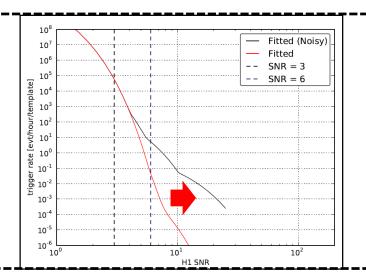

If p > FAP otherwise
```

Case 3 : HL → HL, or HL + random V, or HL + V based on injection ( More realistic case )

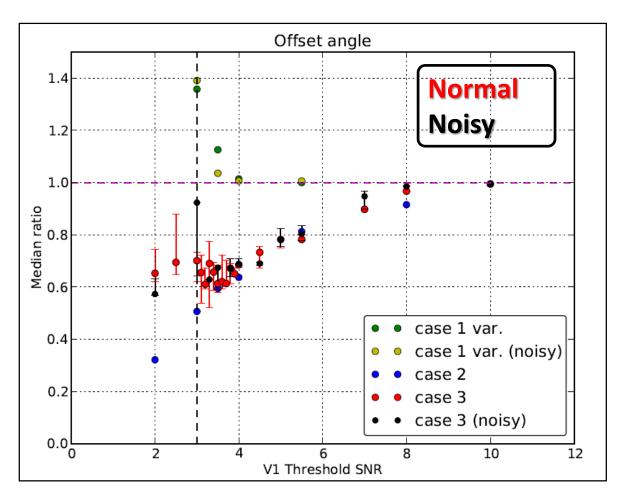

If p < FAP, If p > FAP and V1 SNR < threshold, If p > FAP and V1 SNR > threshold

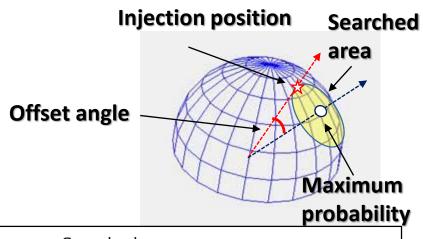

# 1. "random V trigger: Vr"

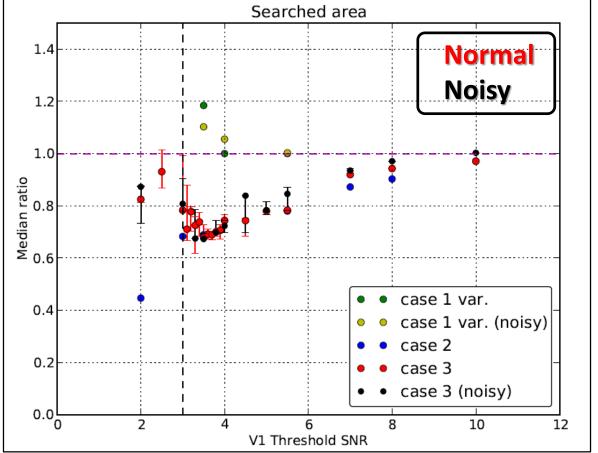

1. SNR = Random above a threshold SNR, following measured O1 SNR distribution

If the background triggers are noisy, the localization can be worse. However, the optimal threshold for V1 still works.

#### **Contents**

- 1. Introduction of hierarchical search
- 2. GW-EM follow up pipe line for low-latency CBC search
- 3. Purpose of this work
- 4. Calculation setup
- 5. Optimization of Virgo threshold
- 6. Summary and KAGRA related topic

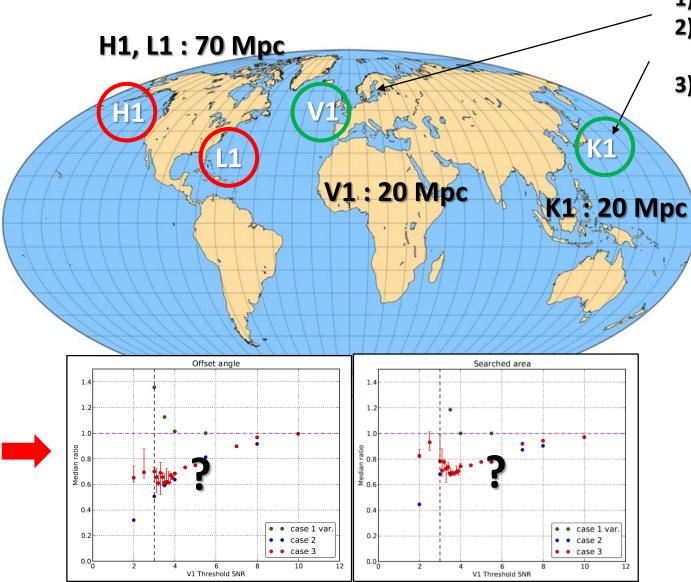

# **Summary**

Investigated sky localization performance in "hierarchical search" with 3 detectors HLV, and look for the optimal threshold for V1

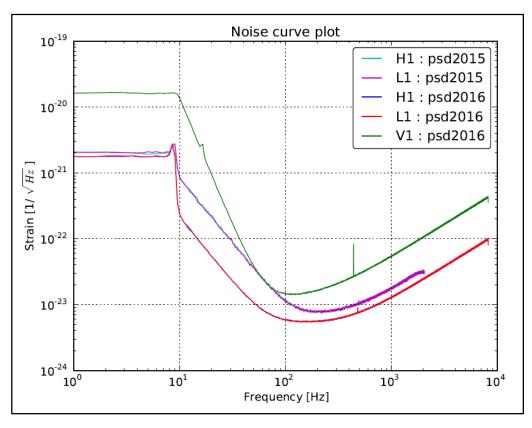

- 1. What is the optimal threshold for the V1?
  - → Optimal threshold for V1 is around 3.5 ~ 4.
- 2. How the localization gets improved at the threshold?
  - → Offset angle, searched area are reduced to ~70 % at the threshold, according to the setup.
- → even if the V1 is less sensitive than H1, L1, in the hierarchical search,
  V1 improves the sky localize performance, comparing to the double detector search.
  - → The hierarchical search is useful to enter newly constructed detectors into the network.

#### ... How about the "Hierarchical search" with 4 detectors HLVK?

# **KAGRA** related topic (Just for introducing)

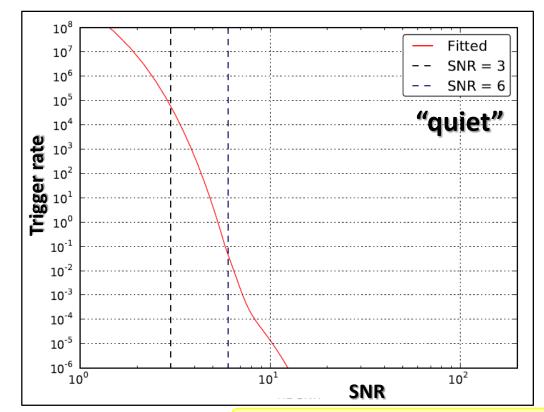

- 1) K1 Noise curve
- 2) K1 Horizon distance are same as V1:
  - H1, L1 = 70 Mpc, V1, K1 = 20 Mpc.
- 3) V1, K1 thresholds are set as same.

Look for the optimal threshold SNR for V1, K1, in this search.

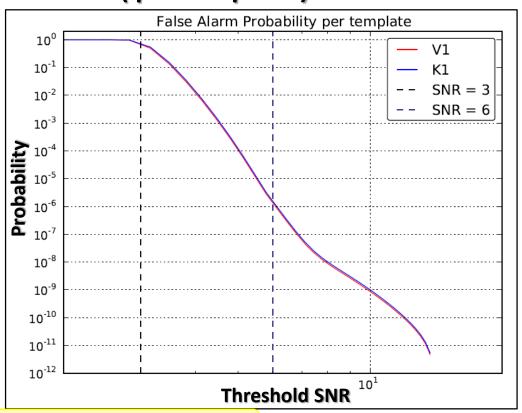

## **KAGRA** related topic: Setup

SNR distribution ( per template )

Parameters for V1, K1 are mostly same in each other. )

# False Alarm Probability ( per template )

$$FAP = 1 - \exp(-R \times T)$$

R = cumulative rate of background triggers per template, above a given threshold, per template,

T = analyzing time for the V1 (less sensitive detector) ~

70 ms for V1 80 ms for K1

# Calculation setup: How to transform the triggers, HL $\rightarrow$ HLV or HLK or HLVK

### Transforming concept is same as the 3-detector search

### 2 Procedure $p_{V1}$ , $p_{K1}$ = random uniform number from 0 to 1. Case 1: V1, K1 triggers are random

$$HL + V_{random} + K_{random}$$

## Case 1 var : V1, K1 triggers are random

```
p_{V1} < FAP_{V1} and p_{K1} < FAP_{K1} \Rightarrow HL + V_{random} + K_{random}
p_{V1} > FAP_{V1} and p_{K1} < FAP_{K1} \Rightarrow HL +
p_{V1} < FAP_{V1} and p_{K1} > FAP_{K1} \Rightarrow HL + V_{random} +
pV_1 > FAP_{V_1} and p_{K_1} > FAP_{K_1} \Rightarrow HL +
```

# Case 2: V1, K1 triggers are based on injection parameter. Best case

```
SNR_{V1} > Threshold_{V1} and SNR_{K1} > Threshold_{K1} \Rightarrow HL + V_{ini} + K_{ini}
SNR_{V1} < Threshold_{V1} and SNR_{K1} > Threshold_{K1} \Rightarrow HL +
SNR_{V1} > Threshold_{V1} and SNR_{K1} < Threshold_{K1} \Rightarrow HL + V_{ini} +
SNR_{V1} < Threshold_{V1} and SNR_{K1} < Threshold_{K1} \Rightarrow HL + +
```

#### Case 3: V1, K1 triggers are either random or based on injection parameters

FAP = FAP(SNR) if SNR > Threshold, otherwise FAP = FAP(Threshold)

•  $p_{V1} < FAP_{V1}$  and  $p_{K1} < FAP_{K1}$ 

 $p_{K1} < FAP_{K1}$ 

- p<sub>V1</sub> < FAP<sub>V1</sub> and,  $\Rightarrow$  HL + V<sub>random</sub> + K<sub>inj</sub>  $p_{K1} > FAP_{K1}$  and  $SNR_{K1} > Threshold_{K1}$ •  $p_{V1} > FAP_{V1}$  and  $SNR_{V1} > Threshold_{V1}$  and  $\Rightarrow$  HL + V<sub>ini</sub> + K<sub>random</sub>
- p<sub>V1</sub> > FAP<sub>V1</sub> and SNR<sub>V1</sub> > Threshold<sub>V1</sub> and  $\Rightarrow$  HL + V<sub>ini</sub> + K<sub>ini</sub>  $p_{K1} > FAP_{K1}$  and  $SNR_{K1} > Threshold_{K1}$
- $p_{V1} < FAP_{V1}$  and  $p_{K1} > FAP_{K1}$  and  $SNR_{K1} < Threshold_{K1}$  $\Rightarrow$  HL + V<sub>random</sub> +
- $p_{V1} > FAP_{V1}$  and  $SNR_{V1} < Threshold_{V1}$  and  $+ K_{random}$  $p_{K1} < FAP_{K1}$  $\Rightarrow$  HL +
- $p_{V1} > FAP_{V1}$  and  $SNR_{V1} > Threshold_{V1}$  and  $p_{K1} > FAP_{K1}$  and  $SNR_{K1} < Threshold_{K1}$  $\Rightarrow$  HL + V<sub>ini</sub>
- $\bullet p_{V1} > FAP_{V1}$  and  $SNR_{V1} < Threshold_{V1}$  and  $p_{K1} > FAP_{K1}$  and  $SNR_{K1} > Threshold_{K1}$  $\Rightarrow$  HL +  $+ K_{ini}$
- $pV_1 > FAPV_1$  and  $SNRV_1 < Thresholdv_1$  and  $p_{K1} > FAP_{K1}$  and  $SNR_{K1} < Threshold_{K1}$  $\Rightarrow$  HL +

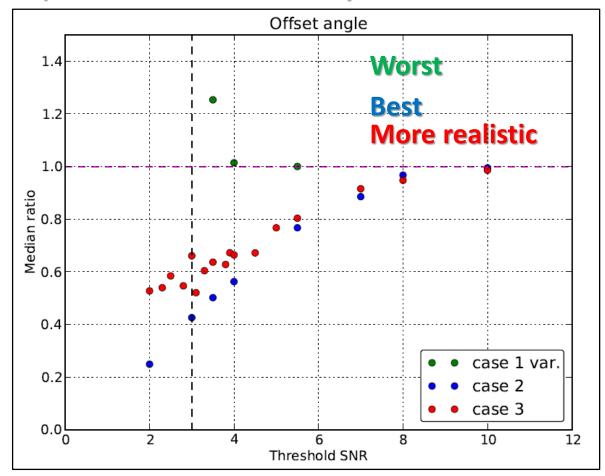

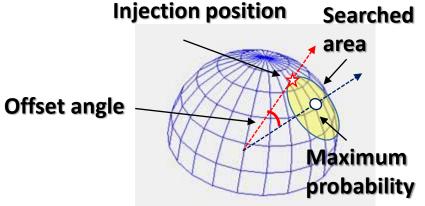

⇒ HL + V<sub>random</sub> + K<sub>random</sub>

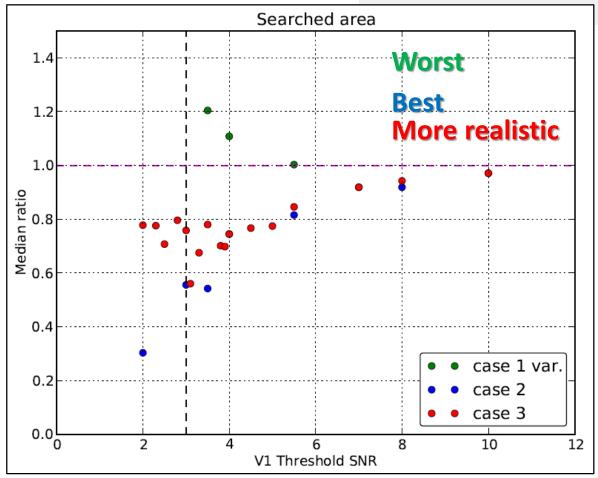

# **Optimization of V1, K1 threshold:**

- 2. Continue the calculation about the hierarchical search with 4 detectors HLVK

•••

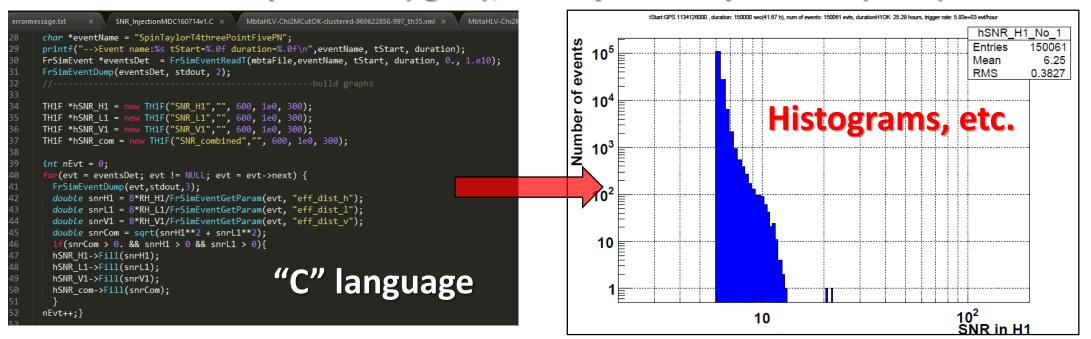

#### **Tools which I learned: Vega**

## vega: plotting tool based on ROOT.

## Mainly (in my case)

- \* Plot histograms, such as SNR distribution.
- \* Fit
- \* Edit MBTA output files (.gwf), or Bayestar input files (.xml)

**Tools which I learned: Bayestar** 

**Bayestar**: mainly

### bayestar\_localize\_coinc:

\* Generate files to plot skymaps (this process needs long time: ~ one night)

# bayestar\_aggregate\_found\_injections:

\* Generate files to plot offsets angles, searched area, 90 % confidence area ,,,

## bayestar\_plot\_allsky :

\* Generate skymaps

```
olserver59[~]: bayestar_bayestar_aggregate_found_injections bayestar_plot_found_injections bayestar_plot_pileup bayestar_plot_pileup bayestar_lattice_tmpltbank bayestar_prune_neighborhood_tmpltbank bayestar_littlehope bayestar_realize_coincs bayestar_localize_coincs bayestar_sample_model_psd bayestar_localize_lvalert bayestar_sim_to_tmpltbank bayestar_plot_allsky olserver59[~]: bayestar_
```

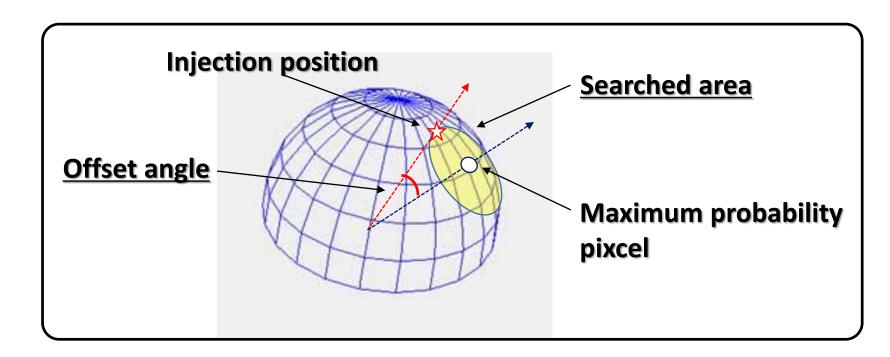

Bayestar has more functions. what I'm using is only these ones.

<sup>\*</sup> Except for them, I'm using "ligolw", some python codes etc.

# Definitions of the offset angle and the searched area:

- 1. Offset angle
- 2. Searched area
- 3. Certain confidence area ( ex. 90 % confidence area )

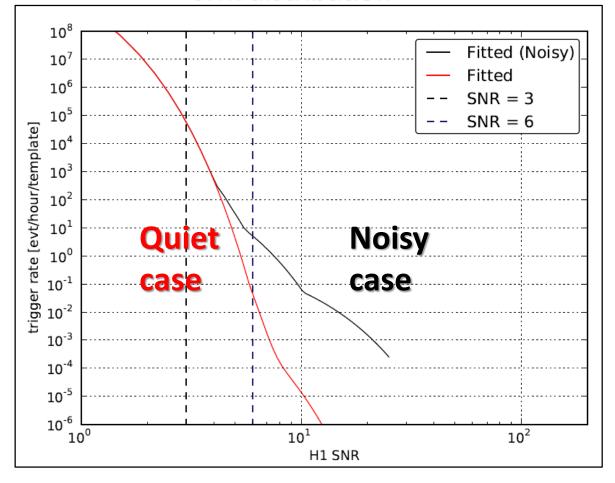

- How far the localization is from the true injected position
- How spread or concentrated each probability is

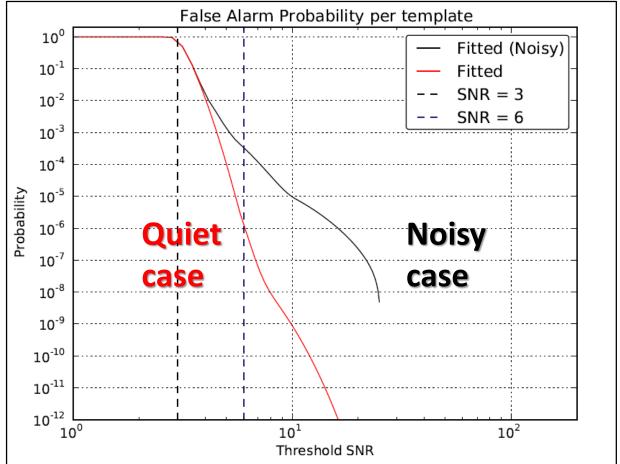

## **Optimization of Virgo threshold:**

# Is the optimal threshold still valid for the noisy case?

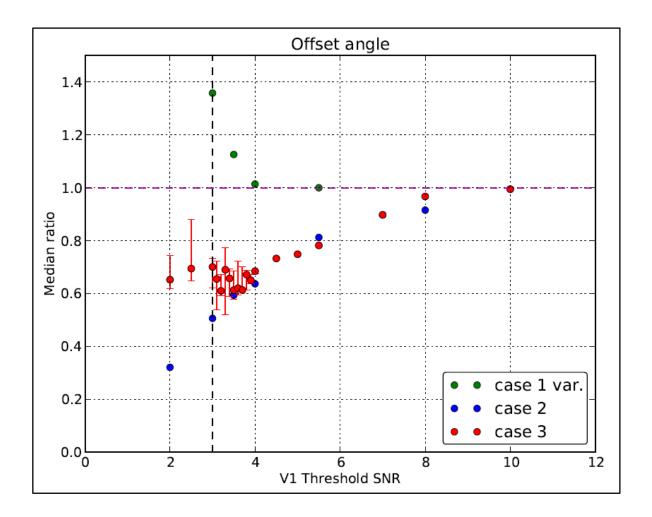

#### **SNR** distribution

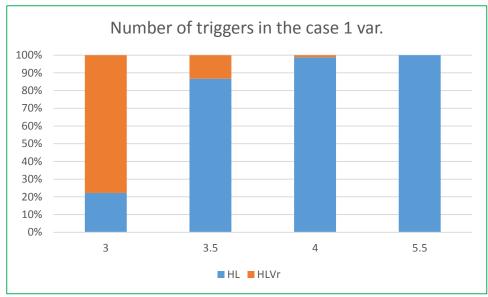

#### **False Alarm Probability**

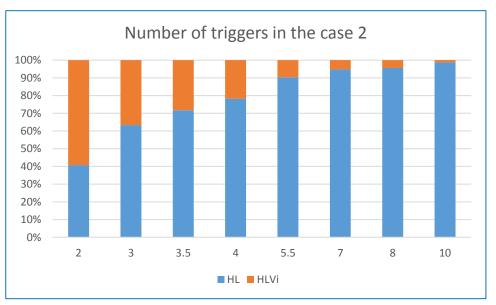

# Update the sky localization performance in the case 3: Summary of sky localization performance

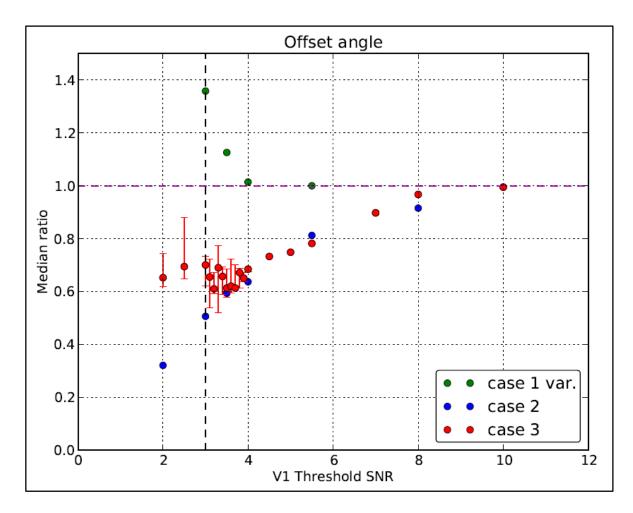

HLVr = HL + Vrandom HLVi = HL + Vinjection

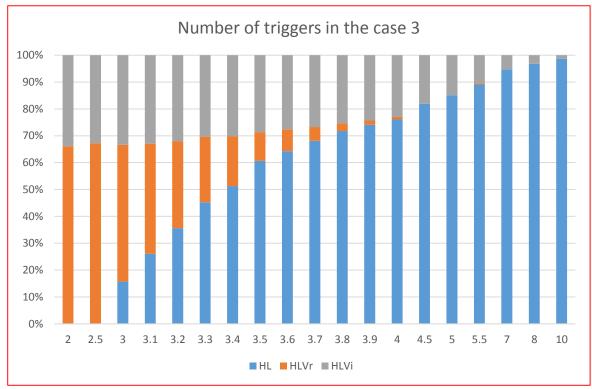

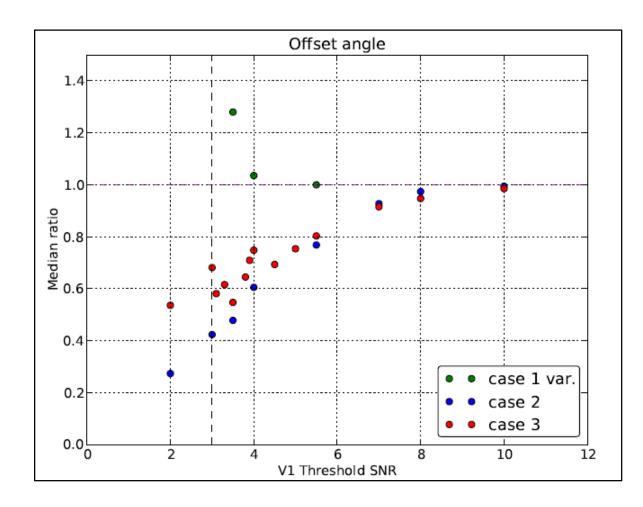

# Update the sky localization performance in the case 3 : Summary of sky localization performance

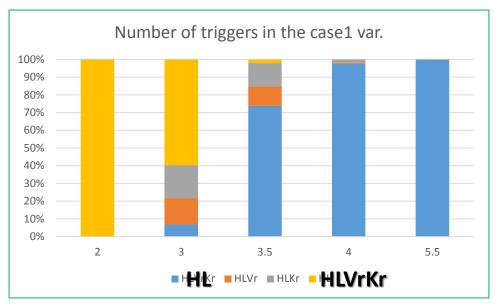

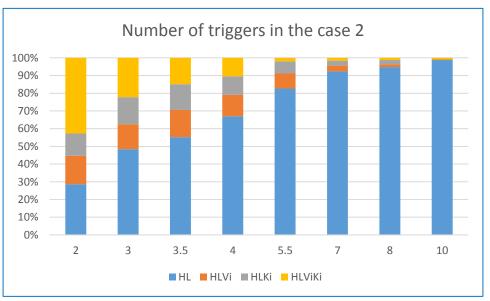

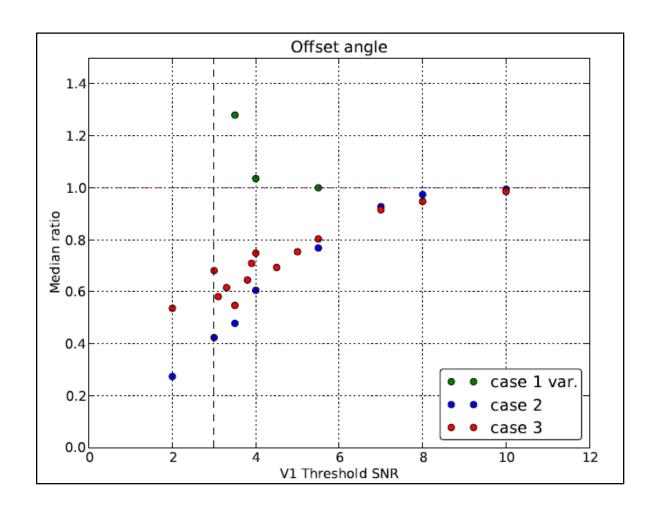

#### Start to generate skymaps with 4 detectors (one-template search)

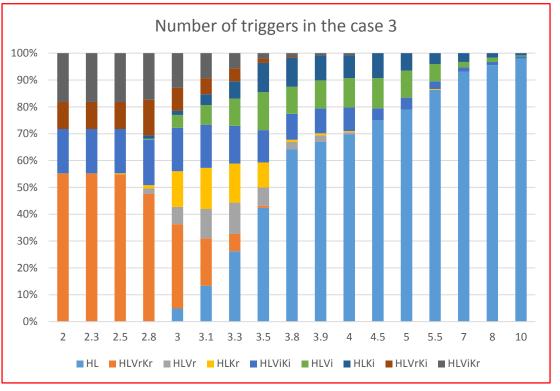

#### Start to generate skymaps with 4 detectors (one-template search)

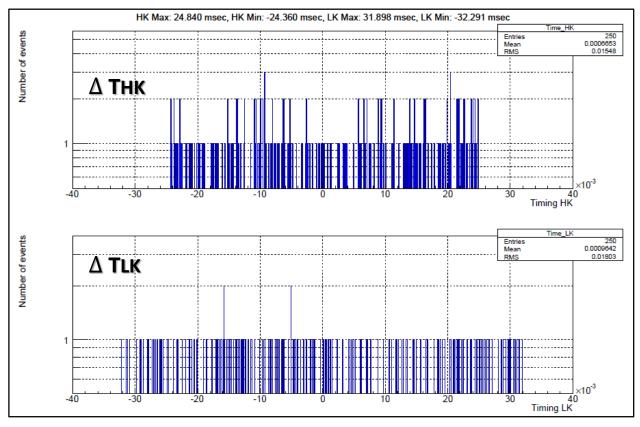

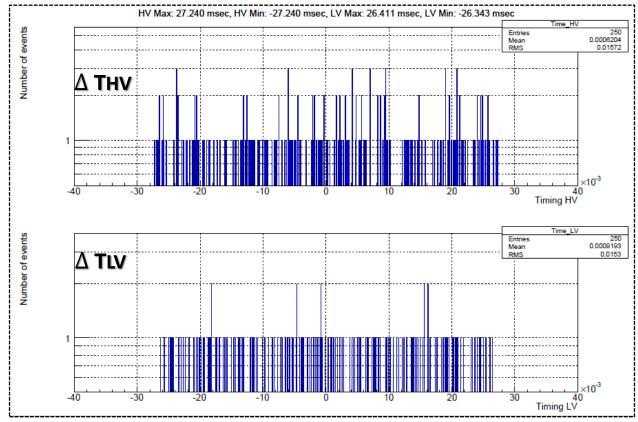

Vr = Vrandom

Vi = Vinjection

Trigger population seems to be strange...

#### \* Start to generate skymaps with 4 detector

$$\Delta T_{HK} \equiv 30 \; \mathrm{msec}$$

$$\Delta T_{LK} \equiv 40 \; \mathrm{msec}$$

$$T \equiv 80 \text{ msec}$$

(T is Time window for searching K1 trigger)

$$\Delta T_{HV} \equiv 35 \text{ msec}$$

$$\Delta T_{LV} \equiv 35 \; \mathrm{msec}$$

$$T \equiv 70 \, \mathrm{msec}$$

(Time window for searching v1 trigger)

#### HL → HL or HLV or HLK or HLVK

#### 1.1 Genetaing random triggers: V<sub>random</sub>, K<sub>random</sub>

- SNR = Raodom above a threshold SNR, following measured O1 SNR distribution.
- Time =  $t_0 + \Delta t$ 
  - $\circ t_0 = t_{\rm H1}$  if SNR<sub>H1</sub> > SNR<sub>L1</sub>, otherwise  $t_0 = t_{\rm L1}$
  - $\circ$   $\Delta t =$  random uniform number:

from -35 ms to 35 ms, for V1.

from ms to ms, for K1.

- Phase = random uniform number from 0 rad to 2π rad.
- Effective distance D<sub>eff</sub> = 2.26 × detection range × 8 / SNR

#### 1.2 Generating triggers based on injection parameters: Vinj, Kinj

- $SNR = SNR^{expected} + \Delta SNR$ 
  - $\circ$  SNR expected = 2.26  $\times$  detection range  $\times$  8 /  $D_{\text{eff}}$
  - $\circ \Delta SNR = random Gaussian(0, 1).$
  - O Deff = injection meta data
  - $\circ$  detection range for V1 = 54 Mpc  $\times$  20 Mpc / 70 Mpc
  - $\circ$  detection range for K1 = 54 Mpc  $\times$  20 Mpc / 70 Mpc
- Time =  $t^{\text{expected}} + \Delta t$
- texpected = injection meta data
- $\circ \Delta t = \text{random Gaussian}(0,1 \text{ ms}).$
- Phase =  $\phi_0 + \Delta \phi$ 
  - $\circ \phi_0 = \phi_{\rm H1} \Delta \phi_{\rm HV}^{\rm expected}$  if SNR<sub>H1</sub> > SNR<sub>L1</sub>, otherwise  $\phi_0 = \phi_{\rm L1} \Delta \phi_{\rm LV}^{\rm expected}$ , for V1
  - $\circ \phi_0 = \phi_{\rm H1} \Delta \phi_{\rm HK}^{\rm expected}$  if SNR<sub>H1</sub> > SNR<sub>L1</sub>, otherwise  $\phi_0 = \phi_{\rm L1} \Delta \phi_{\rm LK}^{\rm expected}$ , for K1

 $\phi_{H1}, \phi_{L1} = injection metadata$ 

 $\Delta \phi_{\mathrm{HV}}^{\mathrm{expected}}, \Delta \phi_{\mathrm{LV}}^{\mathrm{expected}}, \Delta \phi_{\mathrm{HK}}^{\mathrm{expected}}, \Delta \phi_{\mathrm{LK}}^{\mathrm{expected}}$  are generated from injection metadata.

 $\circ \Delta \phi = \text{random Gaussian}(0, 0.25 \text{ rad}).$ 

Note that the Gaussian  $(\mu, \sigma)$  corresponds to this function:

Gaussian
$$(\mu, \sigma) \equiv \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left(-\frac{(x-\mu)^2}{2\sigma^2}\right)$$

#### 2 Procedure

 $p_{V1}$ ,  $p_{K1}$  = random uniform number from 0 to 1.

#### Case 1 : V1, K1 triggers are random

$$HL + V_{random} + K_{random}$$
 (2)

#### Case 1 var : V1, K1 triggers are random

$$p_{V1} < FAP_{V1}$$
 and  $p_{K1} < FAP_{K1} \Rightarrow HL + V_{random} + K_{random}$  (3)

$$p_{V1} > FAP_{V1}$$
 and  $p_{K1} < FAP_{K1} \Rightarrow HL + K_{random}$  (4)

$$p_{V1} < FAP_{V1}$$
 and  $p_{K1} > FAP_{K1} \Rightarrow HL + V_{random} +$  (5)

$$pV_1 > FAPV_1$$

$$p_{K1} > FAP_{K1}$$
 and  $SNR_{K1} > Threshold_{K1} \Rightarrow HL + + K_{inj}$  (18)

 $\Rightarrow$  HL +

 p<sub>V1</sub> > FAP<sub>V1</sub> and SNR<sub>V1</sub> < Threshold<sub>V1</sub> and p<sub>K1</sub> > FAP<sub>K1</sub> and SNR<sub>K1</sub> < Threshold<sub>K1</sub>

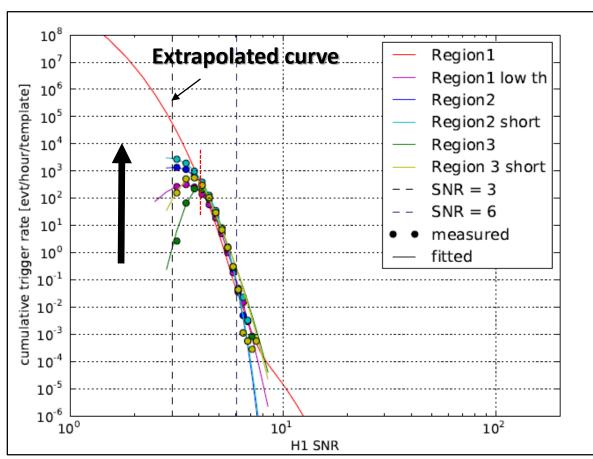

**'54** 

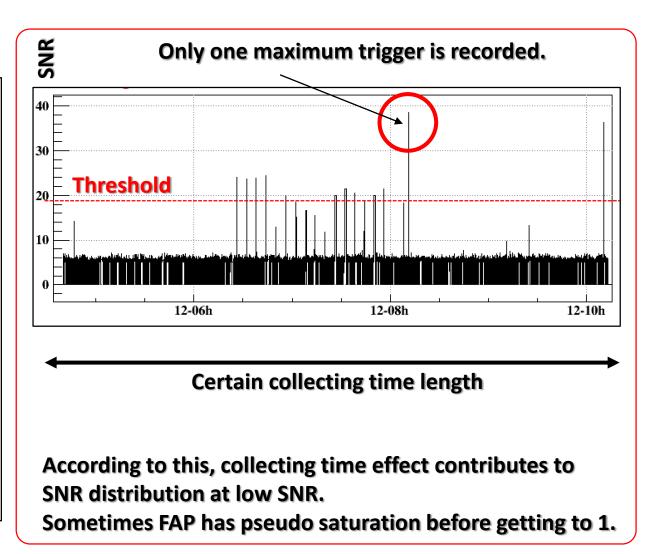

#### \* Start to generate skymaps with 4 detector (V1, K1 threshold = 3.5)

\* Investigate the SNR distribution at low SNR distribution

#### **SNR distribution**

At low SNR, if collecting time gets shorter,

1) the saturation gets better, and 2) curves get close to red line( extrapolated one )

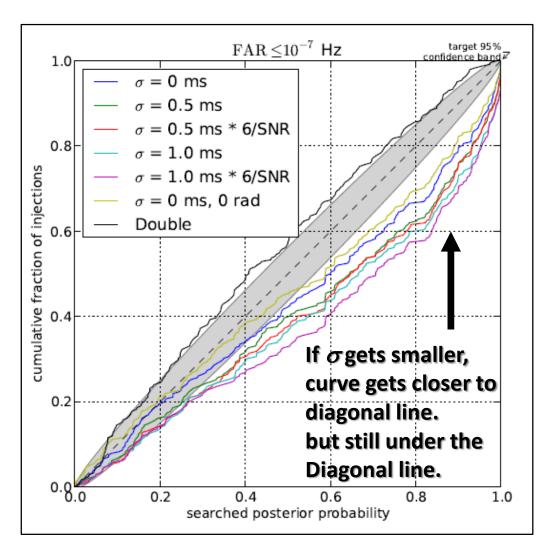

At High SNR, there are mostly no differences  $\rightarrow$  distributions don't depend on how to analyze, and templates.

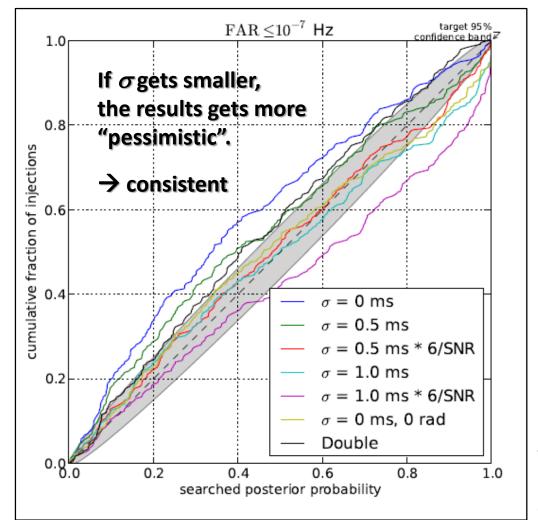

\* Investigate relation between the P-P plot and timing fluctuation

\* ( Arriving time ) = ( meta data ) + ( Gaussian )

Gaussian 
$$\sigma_{\text{Time}} = 1 \text{ ms (Const.)} \rightarrow$$

Gaussian 
$$\sigma_{\text{Time}} = 1 \text{ ms}$$
 (Const.)  $\rightarrow \sigma_{\text{Time}} = \text{Time}$  or  $\text{Time} \times \frac{6}{\text{SNR}}$ 

We cannot judge if the statistics is optimistic or pessimistic, from this P-P pto.

Case 3 ( HL, HLVr, or HLVi )

Case 2 ( HL, or HLVi )
