# Measurement of the fluctuation of the magnetic field in IXC (1)

# Purpose

- In KAGRA, the requirement of the fluctuation of magnetic field in the ITM and ETM is less than  $7\text{pT}/\sqrt{\text{Hz}}@10\text{Hz}$ .
- We measured the fluctuation of the magnetic field in IXC on 12/12-12/20.

# Setup in Kamioka

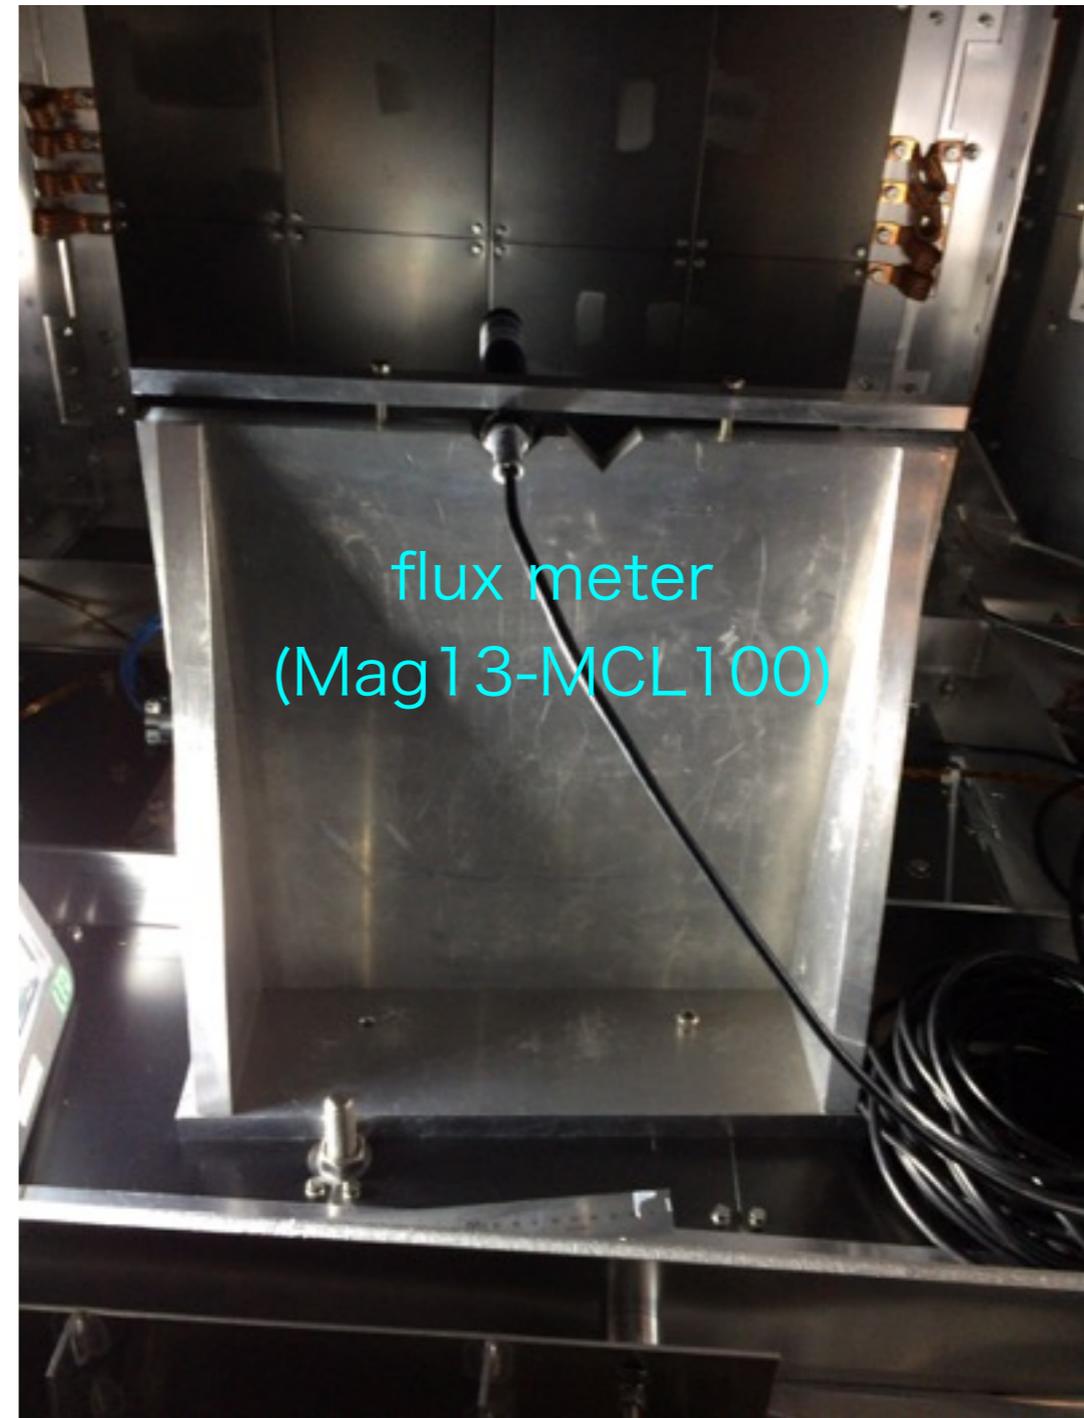

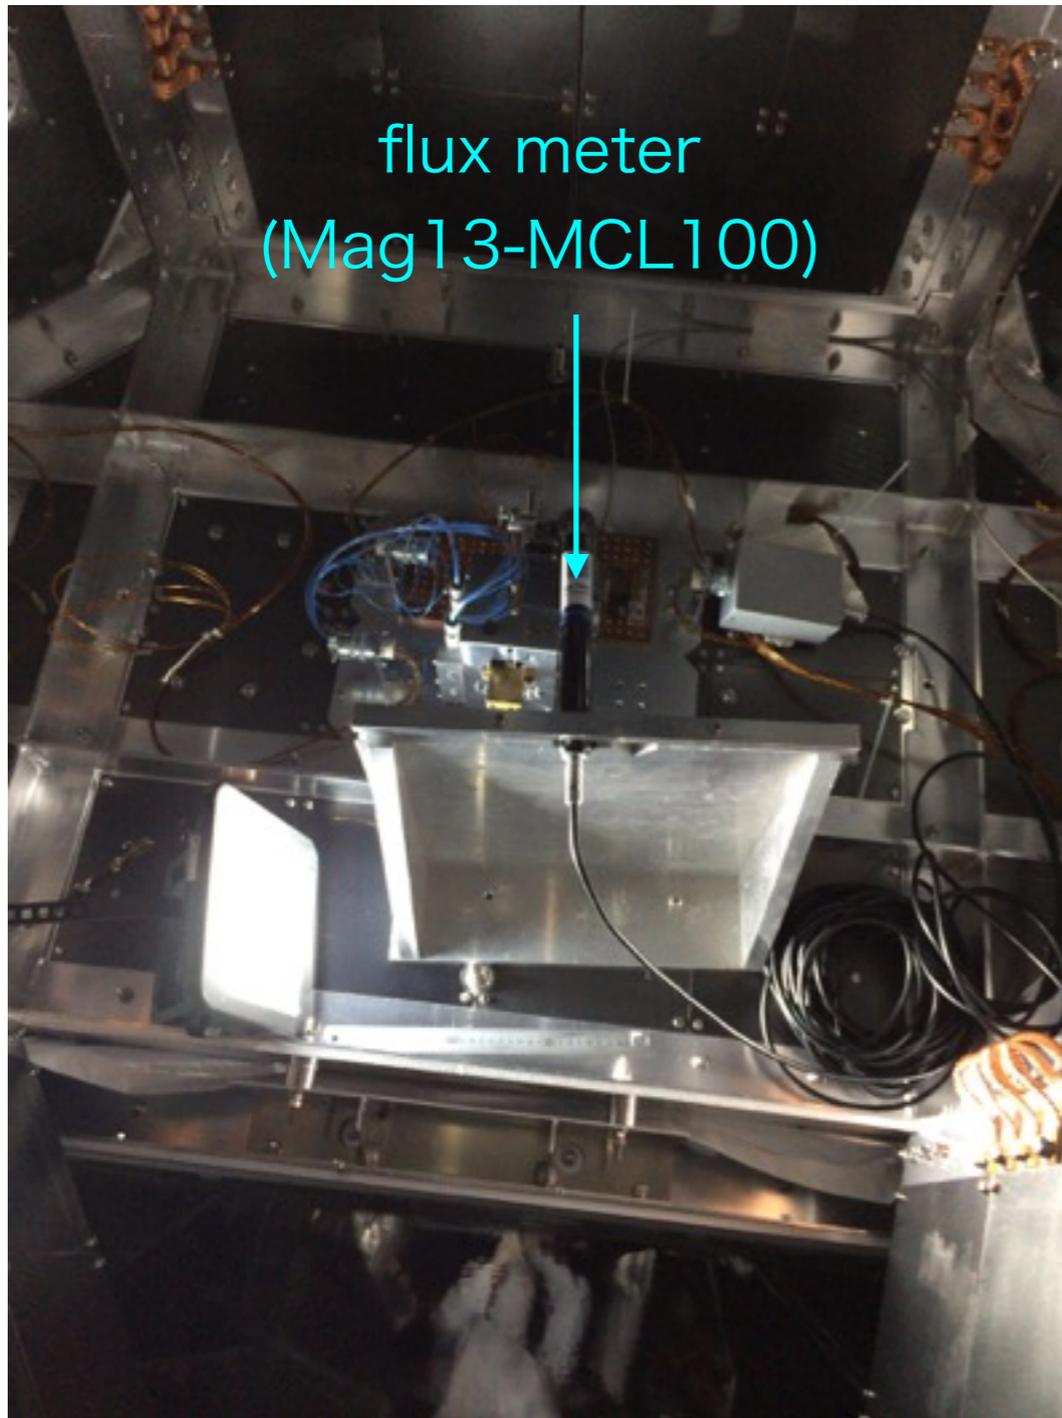

When we use Mag13-MCL100, we can measure all components (xyz).  
Noise level of Mag13-MCL100 is 6pT/rtHz@10Hz (written on the manual).

25Hz (Unknown)

60Hz (Utility frequency)

100Hz (Unknown)

Unknown

This fluctuation seems to be due to the operation of the fan (I will explain later).

The noise floor was about  $5 \text{ pT}/\text{rtHz}$ .

# Cryocooler

We operated the cryocoolers and checked whether the fluctuation of magnetic field would change or not.

# Cryocooler

First we measured the fluctuation while the cryocooler was off.

5 minutes later, we operated the cryocoolers near IXC and measured the fluctuation again.

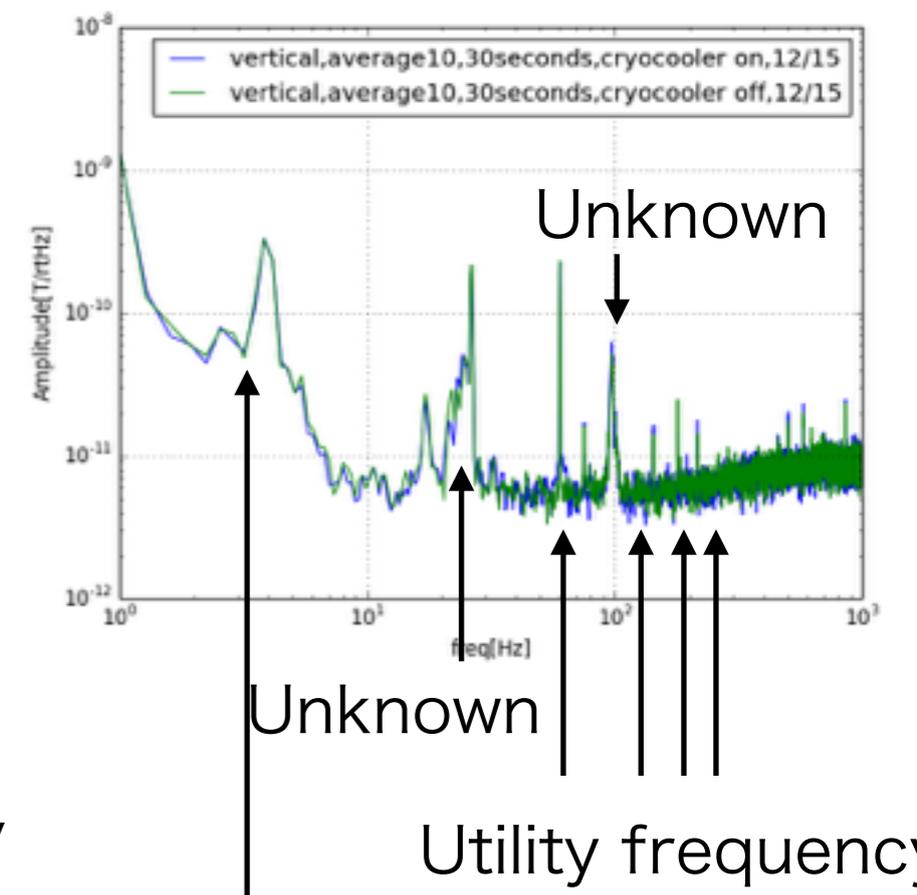

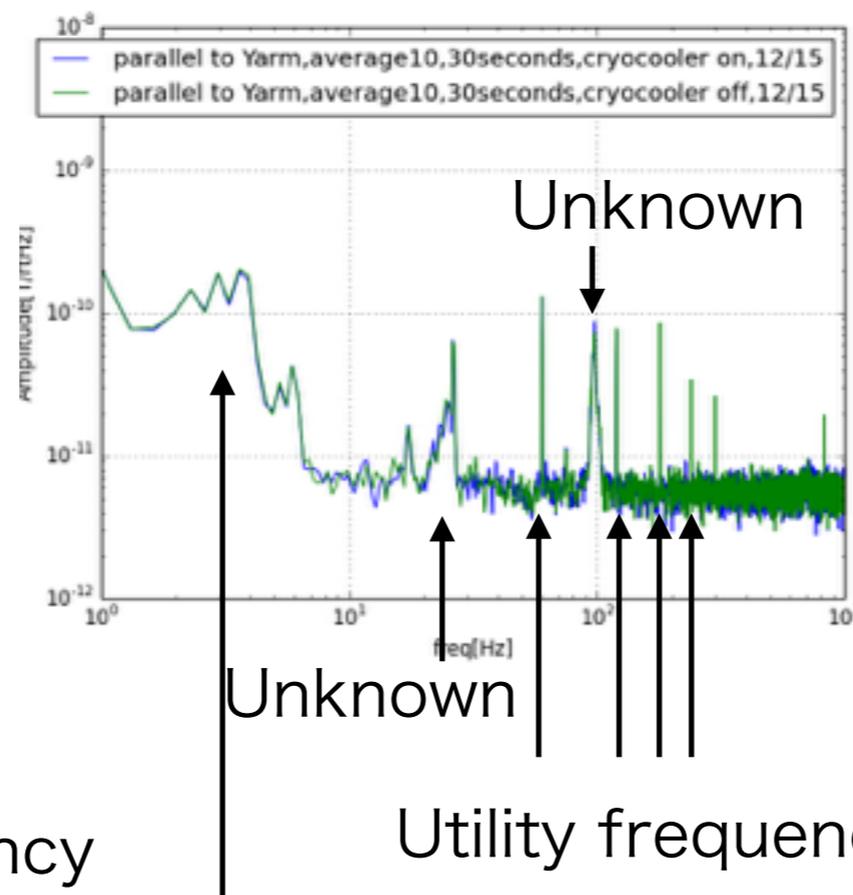

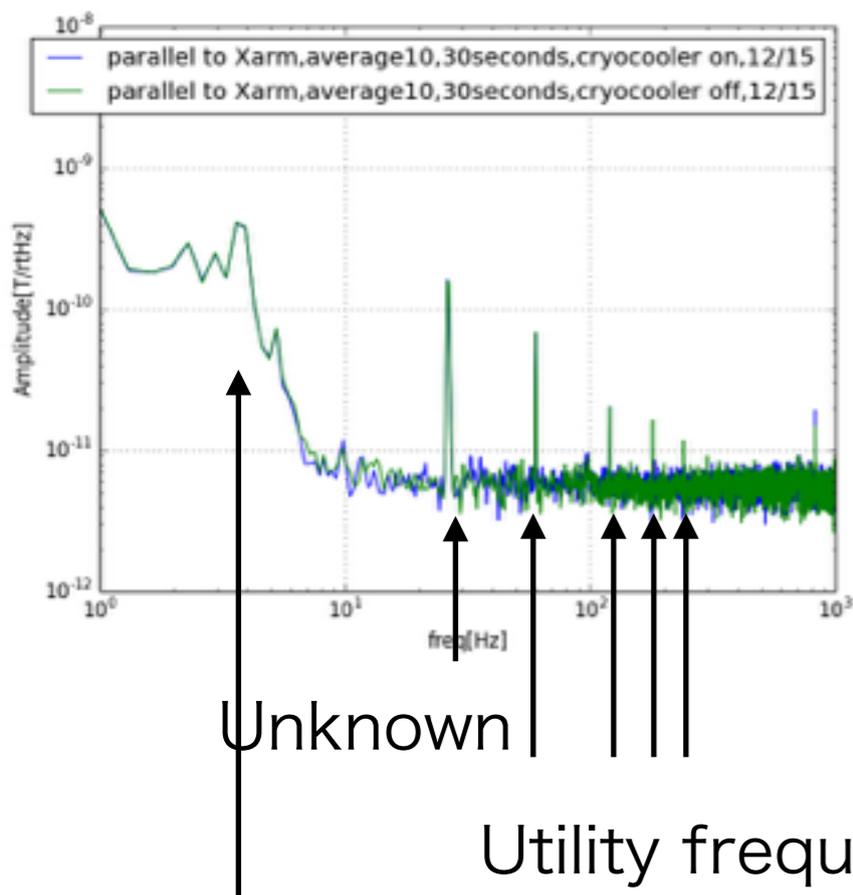

Sampling 20kHz

The fluctuation didn't change so much while the cryocoolers were operating.

parallel to Xarm

parallel to Yarm

vertical

This fluctuation seems to be due to the movement of the fan (I will explain later).

# Fan

We stopped the fan and checked whether the fluctuation of magnetic field would change or not.

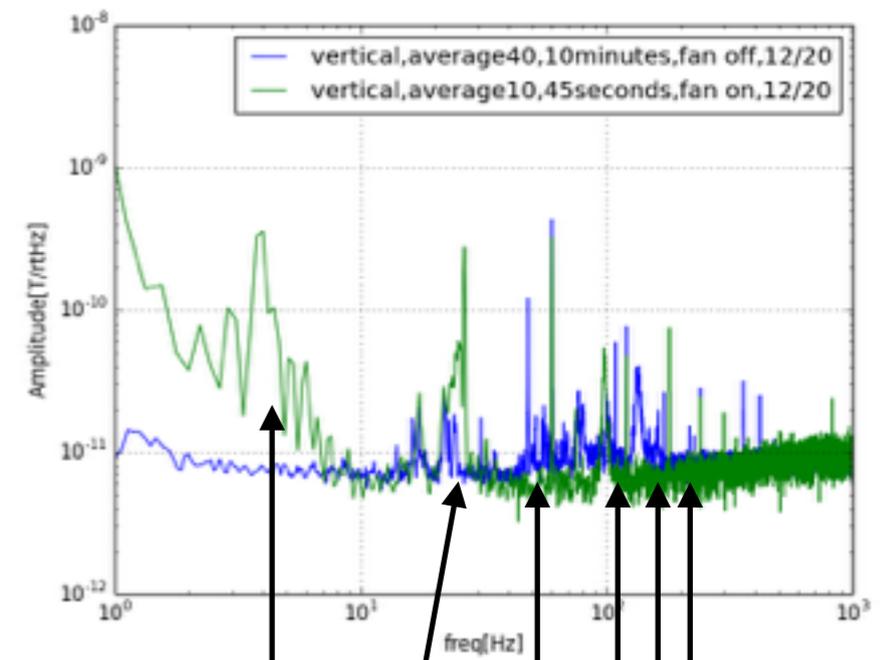

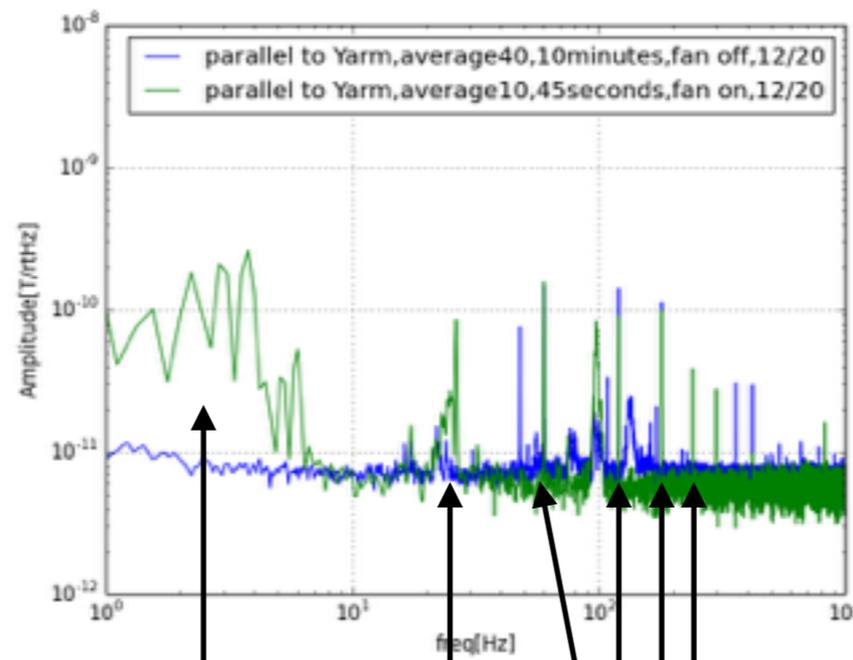

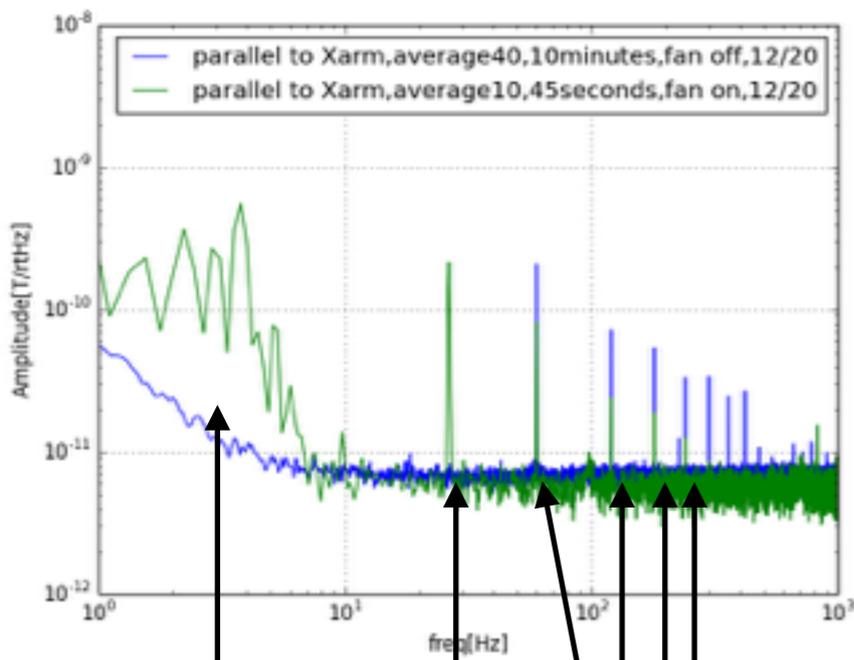

# The fan

First we measured the fluctuation while the fan was on.  
30 minutes later we stopped the fan and measured the fluctuation again.

Unknown Utility frequency

Unknown Utility frequency

Utility frequency  
Unknown

In low-frequency area, the noise became much smaller when we turned off the fan.

# long-time measurement

- We measured the fluctuation during midnight from 12/18 to 12/19.
- I will explain it in the next meeting.

# KAGRA Requirement

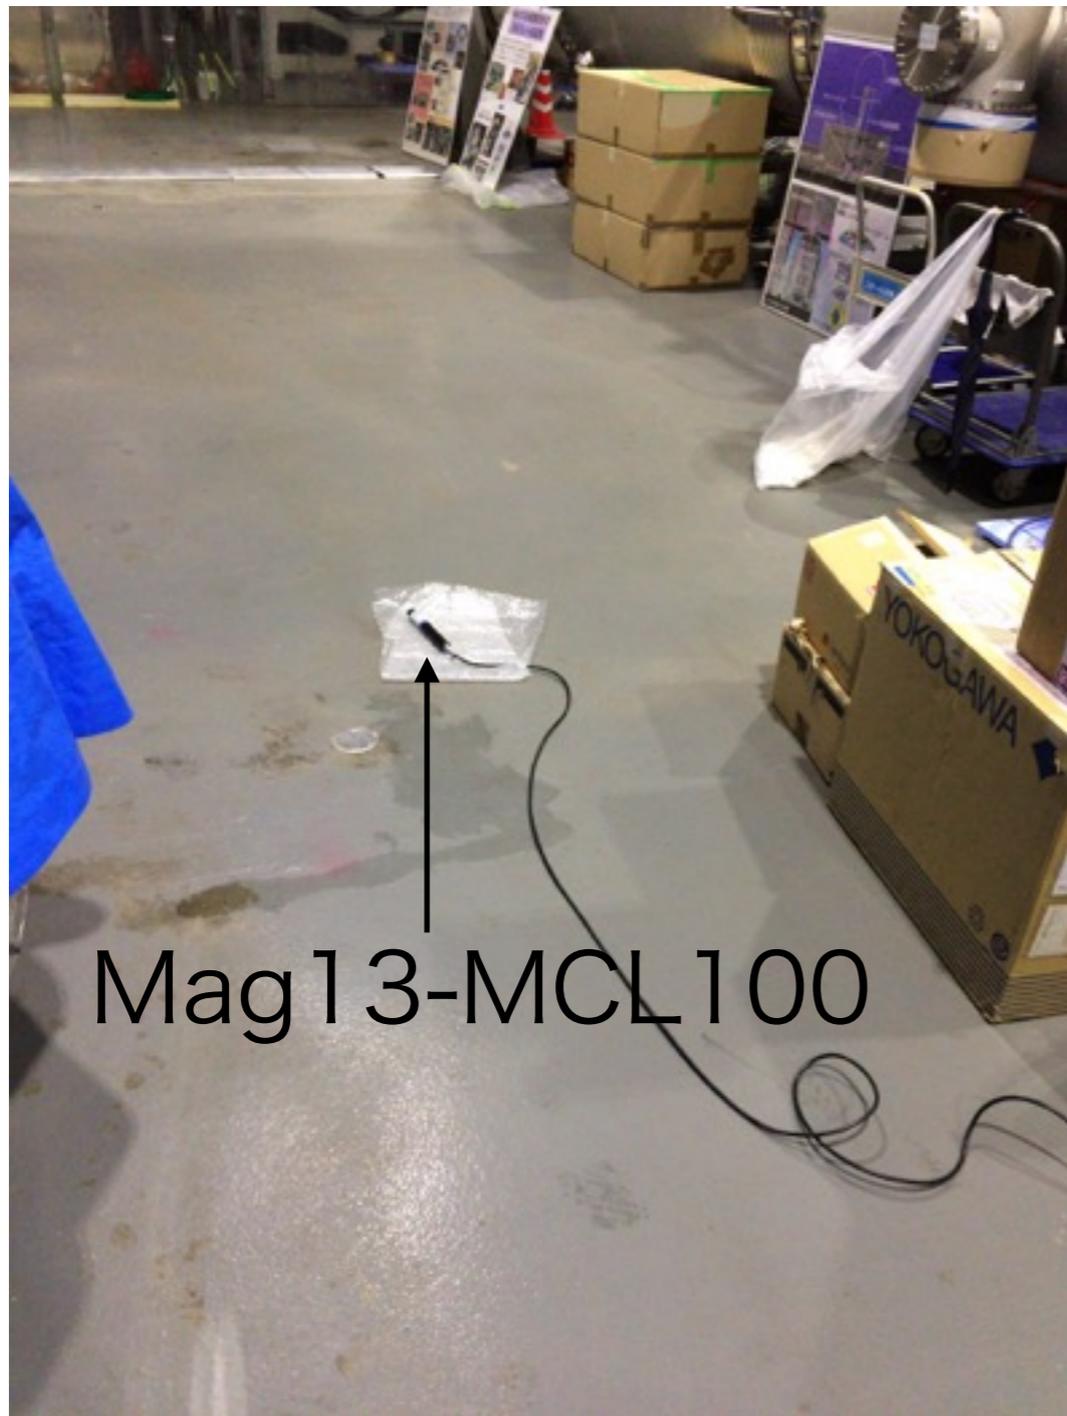

- I heard the KAGRA requirement for ITM and ETM is  $7\text{pT}/\text{rtHz}@10\text{Hz}$ , but this mentions only at 10Hz.
- I am calculating the requirement more exactly (I will show the result in the next meeting).

# Future work

- I will continue the analysis.
- I will explain the rest part of this measurement in the next meeting.

# 加速度計

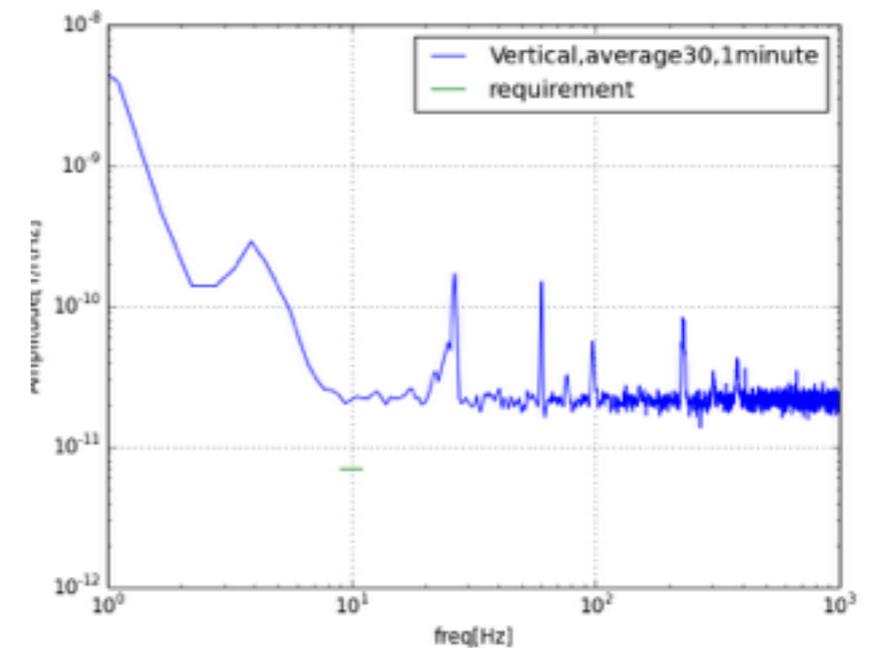

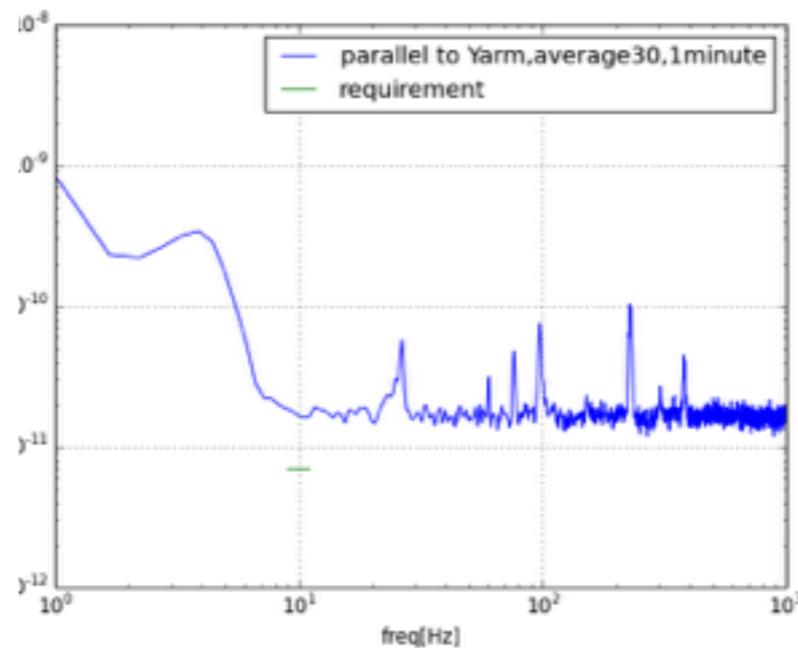

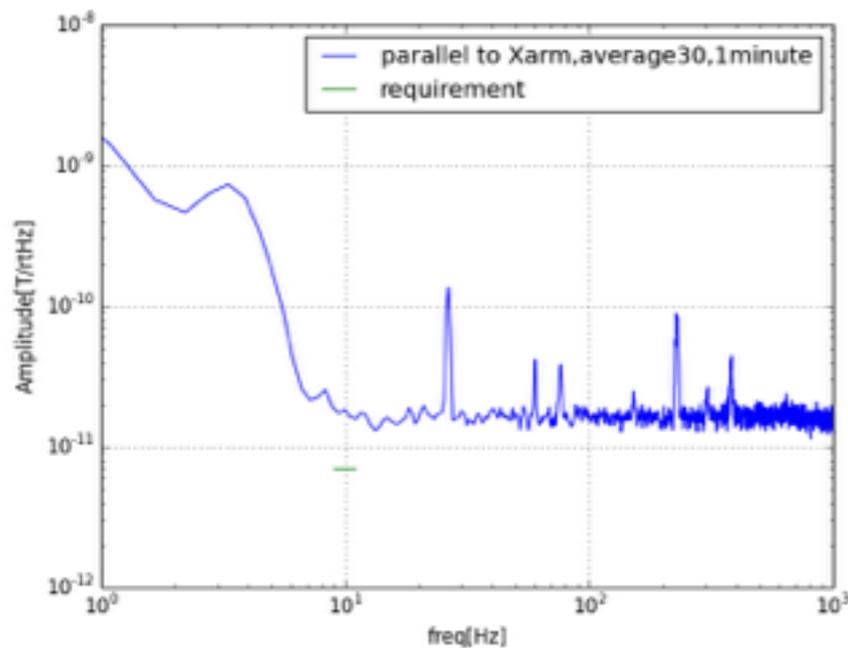

# Inside the cryostat

We changed the sampling rate from 20kHz to 2kHz.  
Sampling rate 2kHz, 1 minute, average 30

parallel to Xarm

parallel to Yarm

Vertical

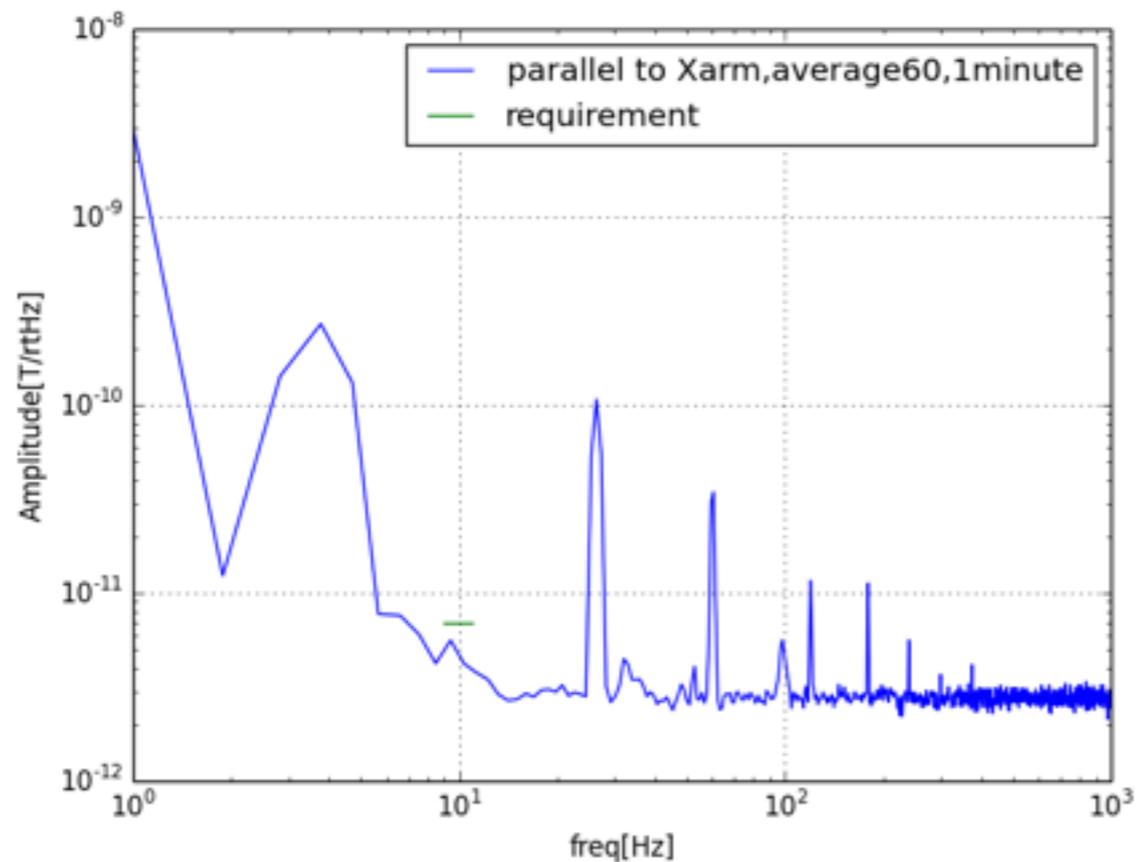

The noise floor was about 15pT/rtHz.

# Sampling rate

- We noticed that the noise floor changed depending on the sampling rate.
- We set the sampling rate as 100kHz and 200Hz and did the measurement.

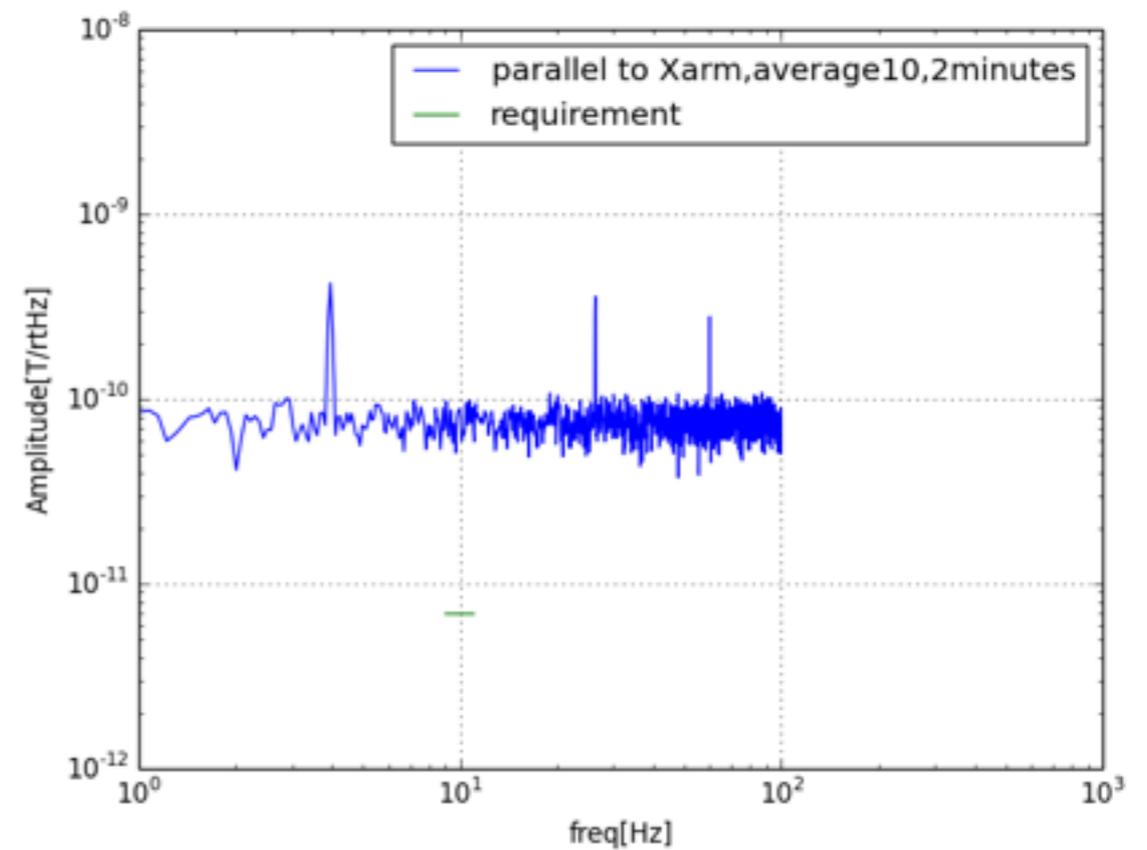

# Inside the cryostat

100kHz  
parallel to Xarm  
average 60  
1 minute

noise floor...3pT/rtHz

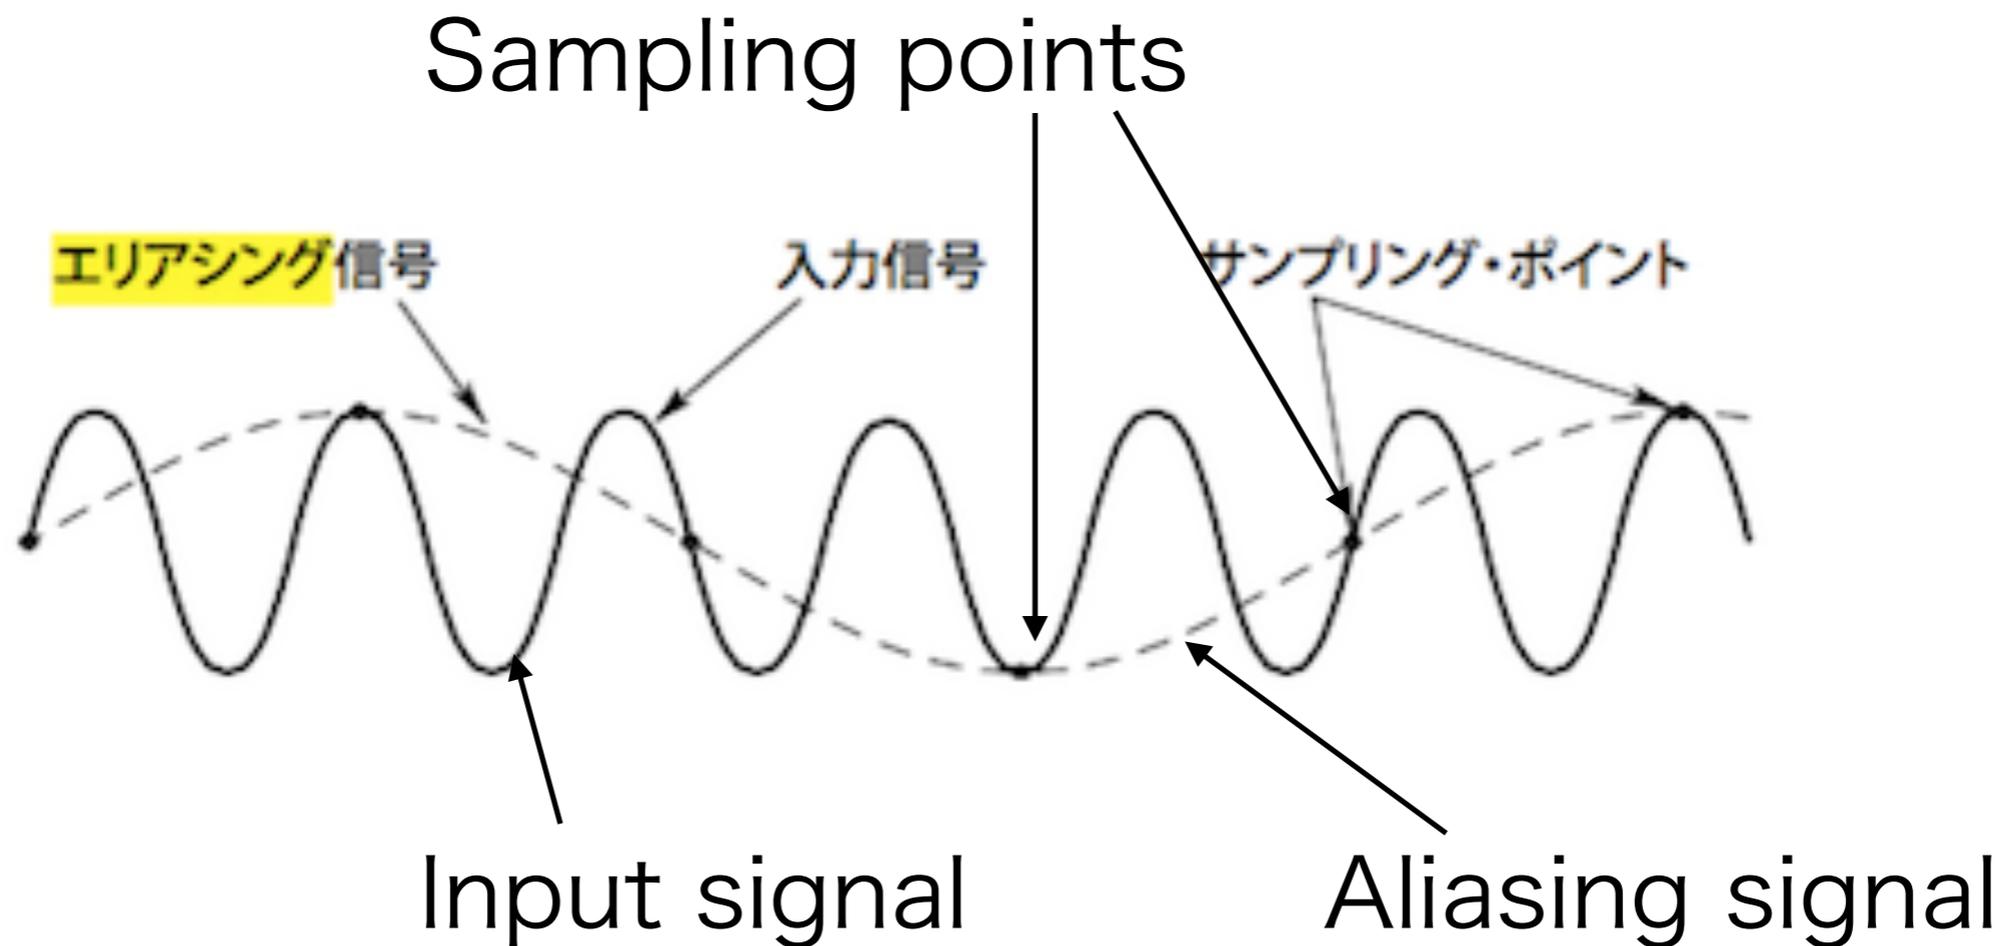

200Hz  
parallel to Xarm  
average 10  
2 minutes

noise floor...70pT/rtHz

# Aliasing

- We considered the possibility of aliasing.

# Checking aliasing in Kashiwa

Sampling rate 20kHz

Raw data  $\cdots \{x_1, x_2, x_3, \cdots\}$

We can make two datas which have 2kHz sampling rate.

(1)  $\{x_1, x_{11}, x_{21}, \cdots\}$

(2)  $\{(x_1+x_2+x_3+x_4+x_5+x_6+x_7+x_8+x_9+x_{10})/10, \cdots\}$

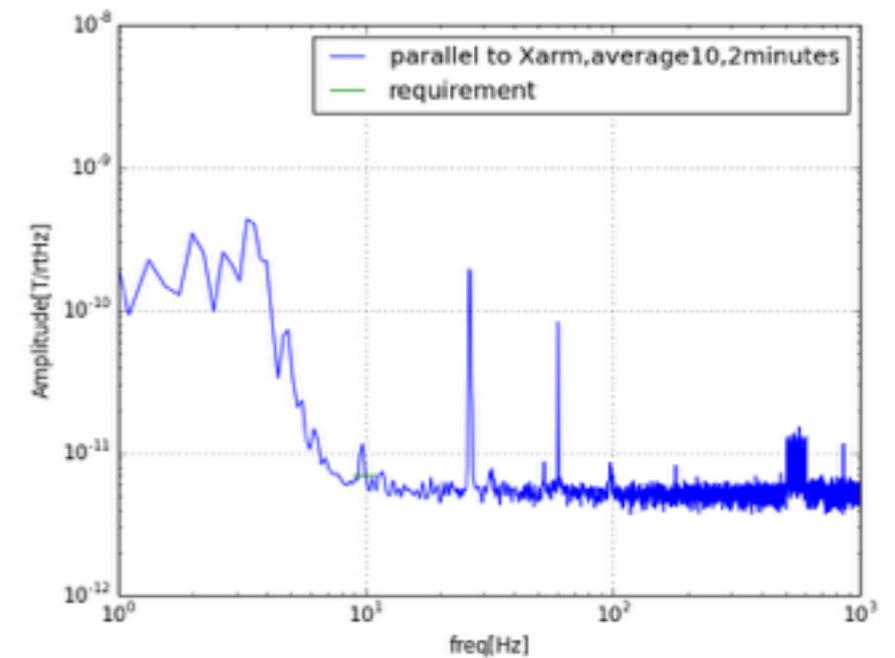

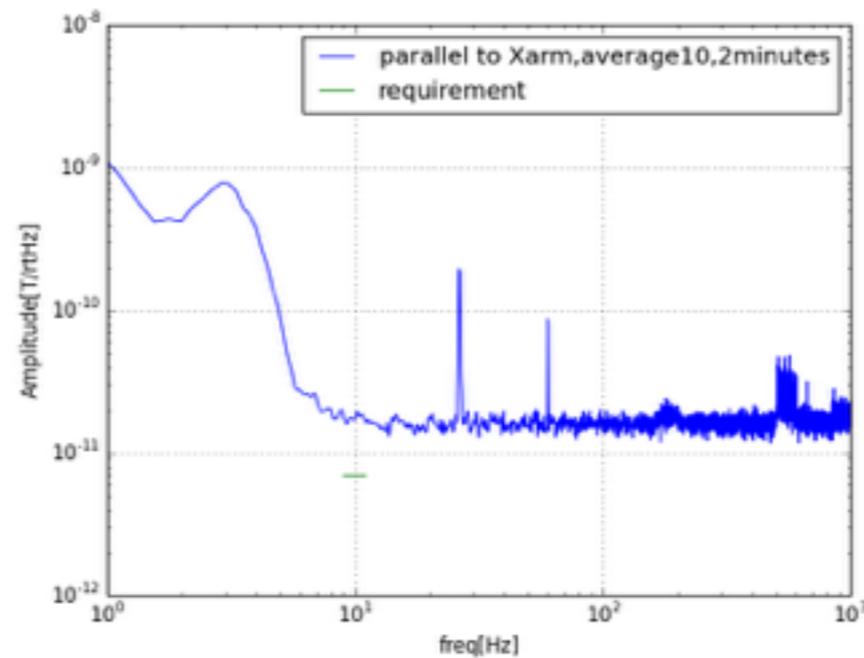

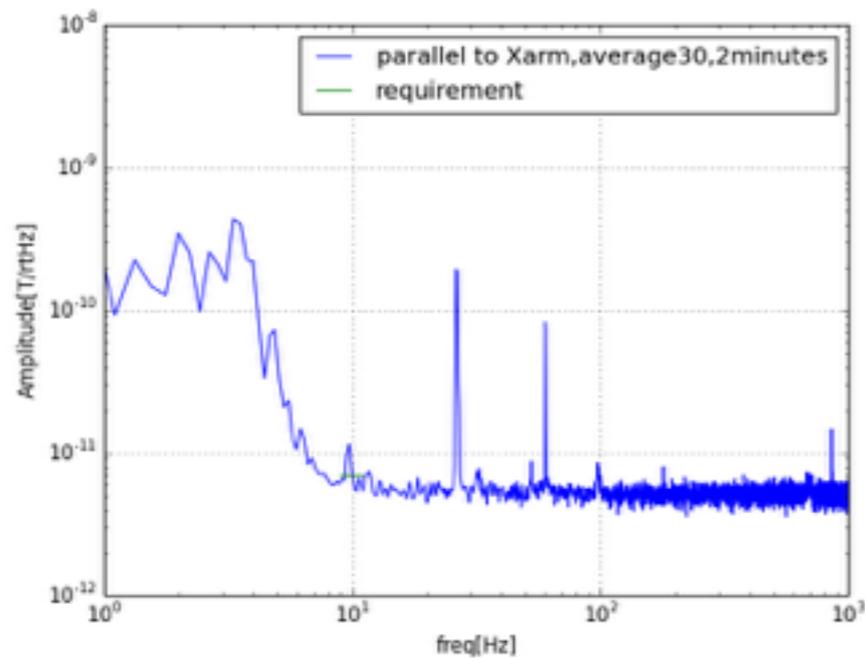

If the aliasing occurs, the noise floor of (2) is smaller than that of (1) because the high-frequency component disappears only in (2).

# 感度曲線

$$\log h = -2.64 \log f - 18.515 \rightarrow h = 3.055 \times 10^{-19} f^{-2.64}$$

出典…KAGRA HP

# JPS (Backup plan)

- 12/10-12/30 Make the program in digital system to get the data automatically
- Jan. 2017 Measure the magnetic field on each part (each end, center)
- Feb. Calculate the noise due to the magnetic field
- Mar. Make the presentation

# Plan for JPS meeting

- 12/10-12/30 Calculate the noise due to the magnetic field
- -Jan. 2017 Make the program in digital system to get the data automatically
- 2/1-2/10? Measure the magnetic field outside IXC
- 2/10?-2/28 Compare the magnetic field between inside and outside.
- Mar. Make the presentation
