

Recent Activities of the AOS

Wide-Angle-Baffles, OpLevs, and Scattering Measurements

Simon ZEIDLER*, Tomotada AKUTSU

Status of Wide-Angle-Baffles (WAB)

- Block scattering coming from the Sapphire test masses
- Scattering may harm goal sensitivity without WAB

- Design (basically) fixed
- Suspension realized by Phosphor-Bronze blade springs
- Inner surface coated with Solblack
- Remaining task:
 - heat-link design
 - Cooling test in NAOJ's cryostat *[comment: not in NAOJ but in KAGRA]*
 - Installation

Cooling simulation with COMSOL

- One point of cooling (4K)
- Constant heat flux through the inner wall
→ 4W scattering
- Equilibrium temperature reached for 7.6K after 10 hours cooling

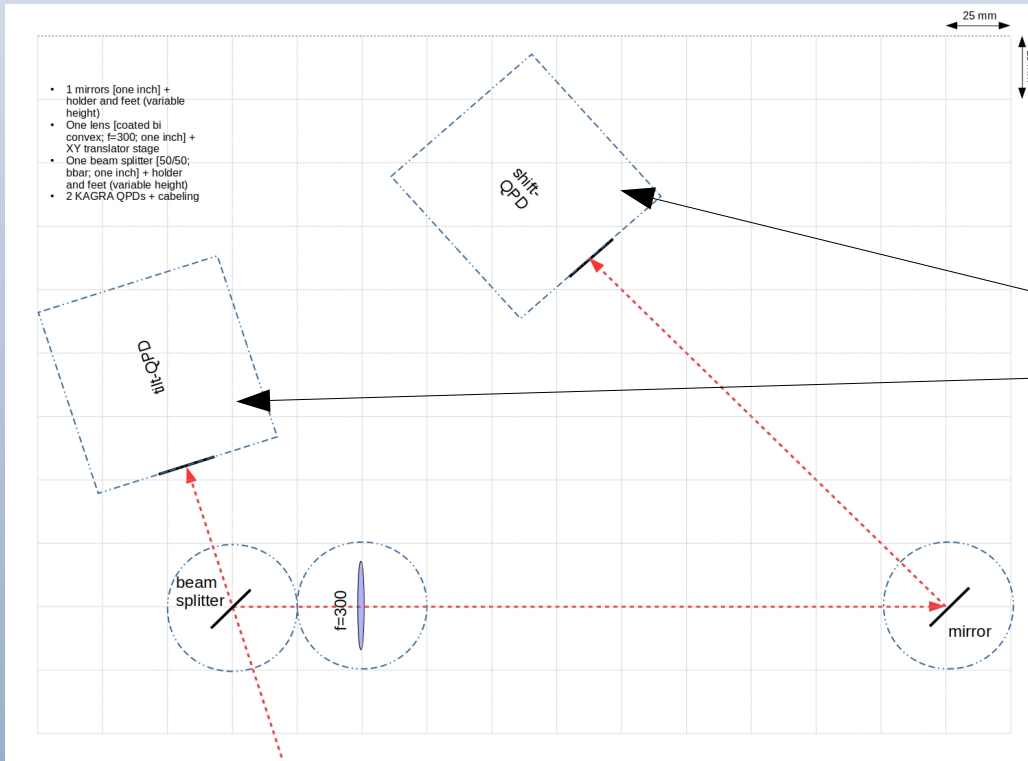

OpLevs

- Two kinds of OpLevs (“optical lever”)
 - tilt-sensing (“regular”)
 - length-sensing (“LS”)
- Measuring the tilt and the horizontal movement of the mirrors

[Comment: D-sub cables too thick?]

08/29/17

KAGRA f2f Toyama University

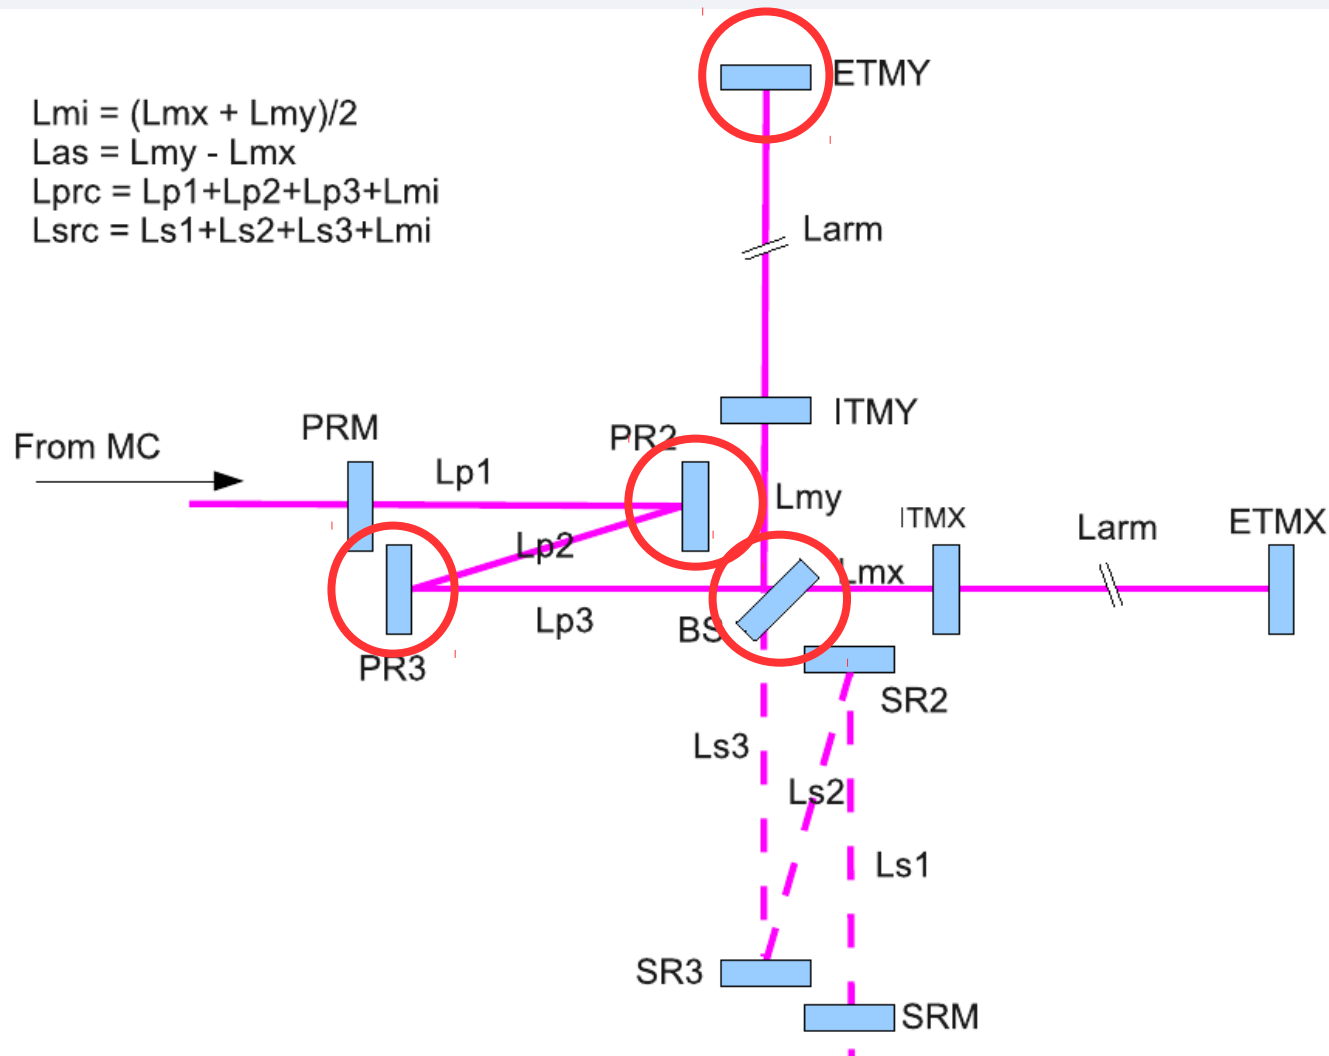

$$L_{mi} = (L_{mx} + L_{my})/2$$

$$L_{as} = L_{my} - L_{mx}$$

$$L_{prc} = L_{p1} + L_{p2} + L_{p3} + L_{mi}$$

$$L_{src} = L_{s1} + L_{s2} + L_{s3} + L_{mi}$$

- Regular and length-sensing OpLevs installed for PR2, PR3, (BS), and ETMY
- Additionally in IMMT
- Special case: PR2

Scattering Measurements

- Recent upgrade of the scatterometer at NAOJ let us measure the scattering around the specular reflection peak with higher accuracy
- Application: SiC and Solblack

Summary

WAB:

- Design almost finished
- Need cryo test
- Installation may be an issue as the WAB is very close to the test mass

OpLev:

- Work is ongoing
- Whenever a mirror is being hung, we will install OpLevs

Scattering Measurements:

- Updated instrument with 0.01° angular resolution
- Recent measurements of SiC and SolBlack have very good agreement with reflection measurements
- Paper is currently being written (to be submitted within this year, hopefully...)

Thank you for your attention!
