KAGRA: 2.5 generation interferometric gravitational wave detector

KAGRA collaboration

The recent detections of gravitational waves (GWs) reported by the LIGO and Virgo collaborations have made a significant impact on physics and astronomy. A global network of GW detectors will play a key role in uncovering the unknown nature of the sources in coordinated observations with astronomical telescopes and detectors. Here we introduce KAGRA, a new GW detector with two 3 km baseline arms arranged in an 'L' shape. KAGRA's design is similar to the second generations of Advanced LIGO and Advanced Virgo, but it will be operating at cryogenic temperatures with sapphire mirrors. This low-temperature feature is advantageous for improving the sensitivity around 100 Hz and is considered to be an important feature for the third-generation GW detector concept (for example, the Einstein Telescope of Europe or the Cosmic Explorer of the United States). Hence, KAGRA is often called a 2.5-generation GW detector based on laser interferometry. KAGRA's first observation run is scheduled in late 2019, aiming to join the third observation run of the advanced LIGO–Virgo network. When operating along with the existing GW detectors, KAGRA will be helpful in locating GW sources more accurately and determining the source parameters with higher precision, providing information for follow-up observations of GW trigger candidates.

Seeing is believing. We were reminded of this proverb when we received the news of the discovery of GW150914, the first direct detection of gravitational waves (GWs)[1]. The existence of GWs has been believed since Russel Hulse and Joseph Taylor discovered the binary pulsar PSR B1913 + 16 in 1974 (ref. [2]). The long-term radio observation of this system has shown that the observed orbital decay is well described by the energy/angular momentum loss due to GW emission as predicted by Einstein in 1915 (ref. [3]).

Figure 1 shows the location of KAGRA in Kamioka, Japan. The interferometer shares the area with the well-known neutrino detectors Super-Kamiokande and KamLAND. Kamioka is a small town located 1.5 hour driving distance from the city of Toyama, with its biggest claim to fame being an old mine.

Compared with existing laser interferometers, KAGRA is technologically unique in two features. Firstly, it is located in an underground site to reduce seismic noise. Secondly, KAGRA's test masses

Japan's Kamioka Gravitational Wave Detector is scheduled to start up in 2019, joining a global network of interferometers.

PHYSICS

Japan to begin pioneering hunt for gravitational waves

The underground KAGRA detector will deploy ambitious technology to improve sensitivity.

BY DAVIDE CASTELVECCHI

Inside a house-sized scaffolding wrapped in thick plastic sheets, Takayuki Tomaru is in full clean-room attire. The physicist, who works at the High Energy Accelerator Research Organization (KEK) in Tsukuba, Japan, is performing one of the most delicate and crucial tasks in the construction of a gravitational-wave observatory: installing one of the machine's four mirrors, each a 23-kilogram cylinder of solid sapphire known as a test mass.

When operations begin later this year, their job will be to bounce infrared laser beams back and forth along two 3-kilometre, high-vacuum pipes, ready to sense the passage of gravitational waves (see 'Japan's wave hunter').

The ¥16.4-billion (US$148-million) observatory — Japan's Kamioka Gravitational Wave Detector (KAGRA) — will work on the same principle as the two detectors of the Laser Interferometer Gravitational-Wave Observatory (LIGO) in the United States and the Virgo solo machine in Italy. In the past few years, these machines have begun to detect gravitational waves — long-sought ripples in the fabric of space-time, created by cataclysmic cosmic events such as the merging of two black holes or the collision of two neutron stars.

With the addition of KAGRA, the growing global network of detectors will enable astrophysicists to locate the position of these feeble cosmic signals in the sky with greatly increased precision. They will be able to dissect the waves' properties, such as how they are

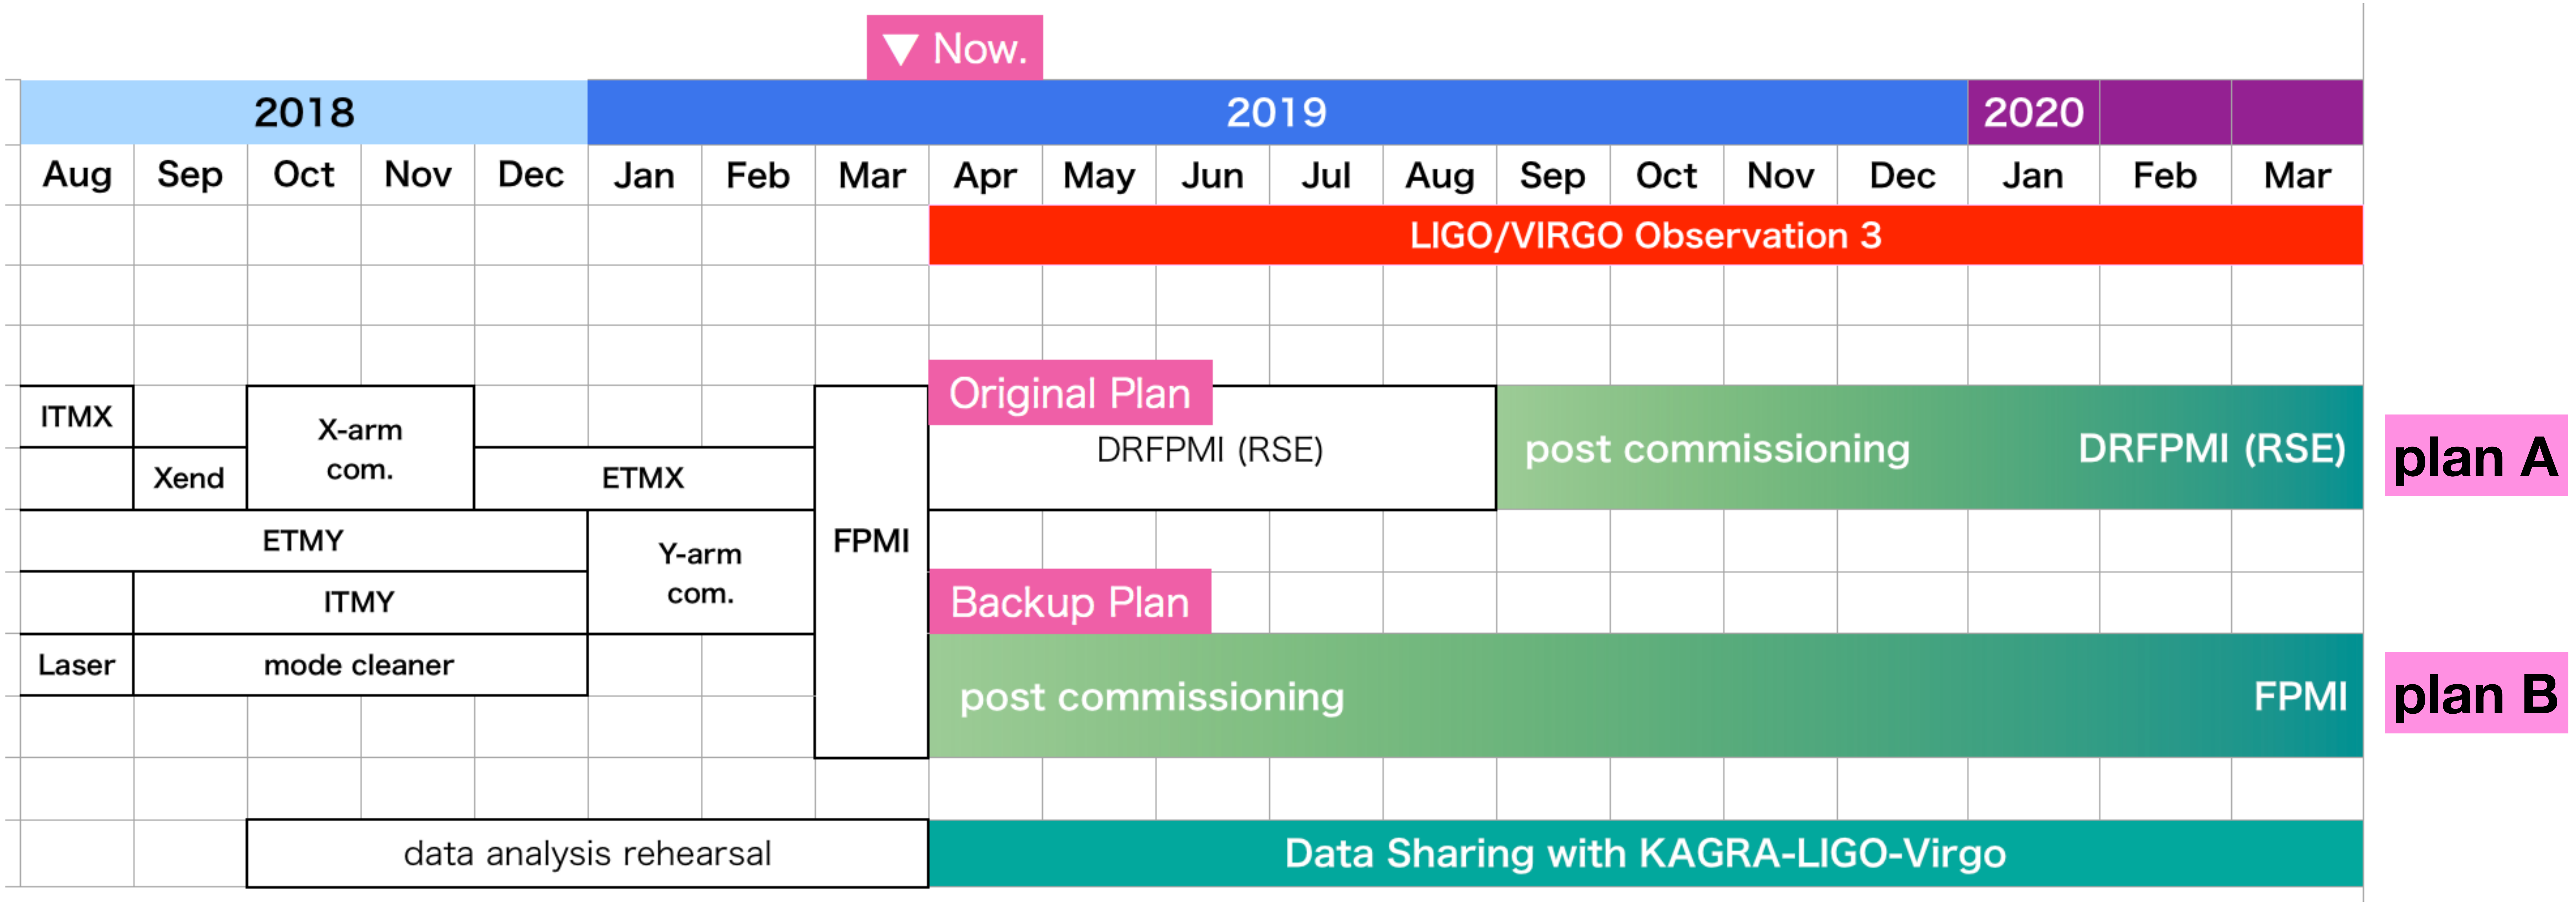
Roadmap to join O3: Plan A & B

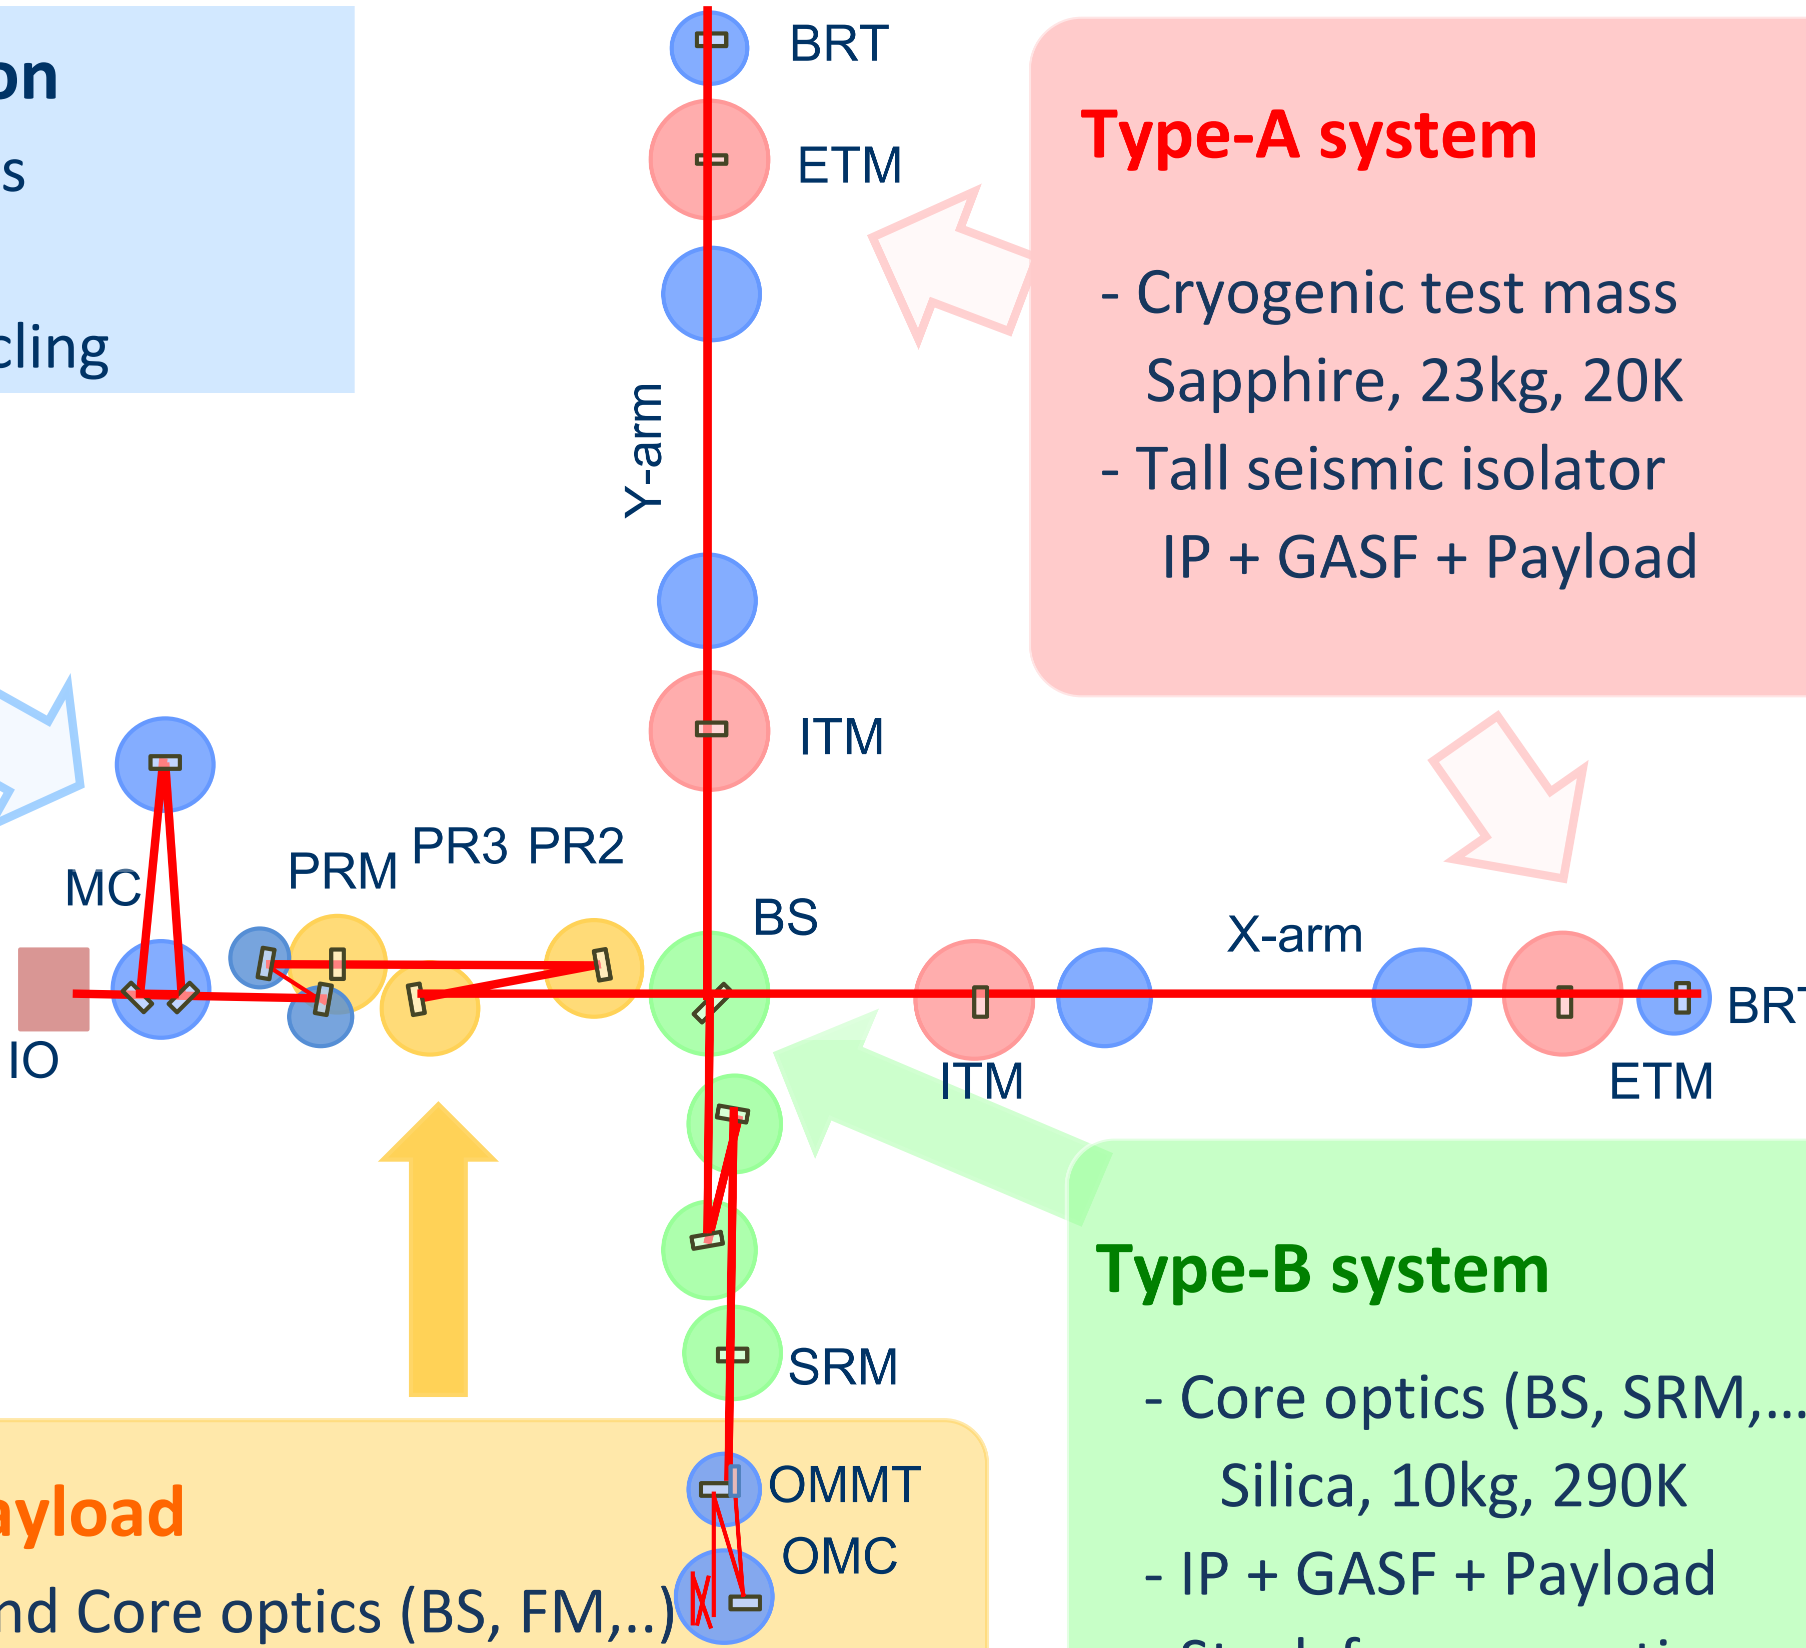


— either DRFPMI(RSE) (-25Mpc, Oct?) or FPMI (-10Mpc, June?)
checking points: Sep/2018, Dec/2018 and Mar/2019

bKAGRA configuration & installation 2018-2019

bKAGRA configuration
- Cryogenic test masses
- 3 km arm cavities
- RSE with power recycling

160222_SAITO



Type-A system
- Cryogenic test mass
  Sapphire, 23kg, 20K
- Tall seismic isolator
  IP + GASF + Payload

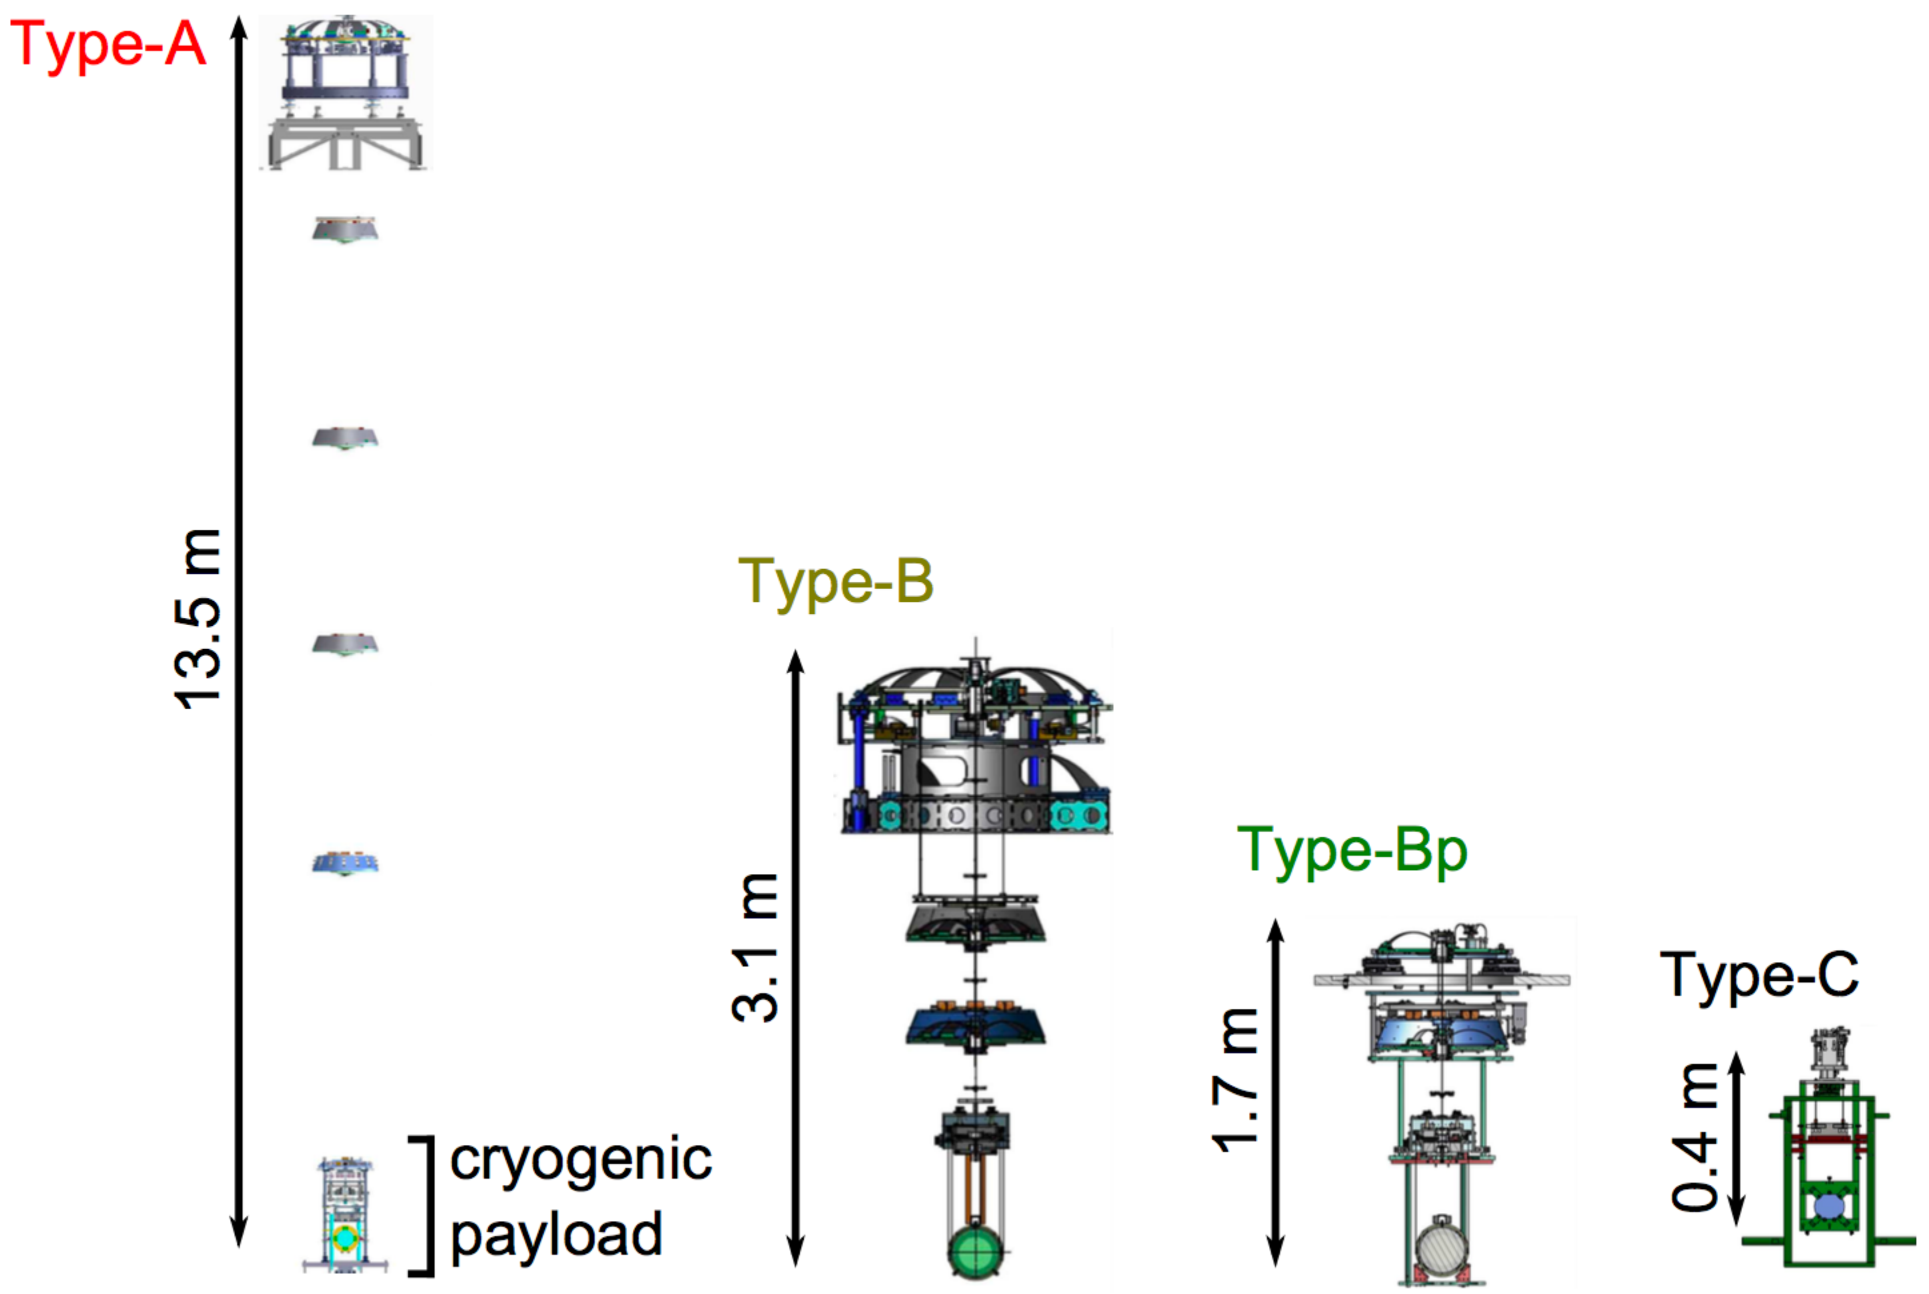
Type-C system
- Mode cleaner
  Silica, 0.5kg, 290K
- Stack + Payload

Type-B system
- Core optics (BS, SRM,…)
  Silica, 10kg, 290K
- IP + GASF + Payload
- Stack for aux. optics

Type-Bp payload
- Test mass and Core optics (BS, FM,..)
  Silica, 10kg, 290K
- Seismic isolator
  Table + GASF + Type-B Payload

【VIS】

ALL the large suspensions have been installed!
Tunings are ongoing along with the alignment.



【Mirror】

ALL Sapphire mirrors are installed.

KSC newsletter (2018 Dec.)

【CAL】

Photon calibrator modules installed at the both ends

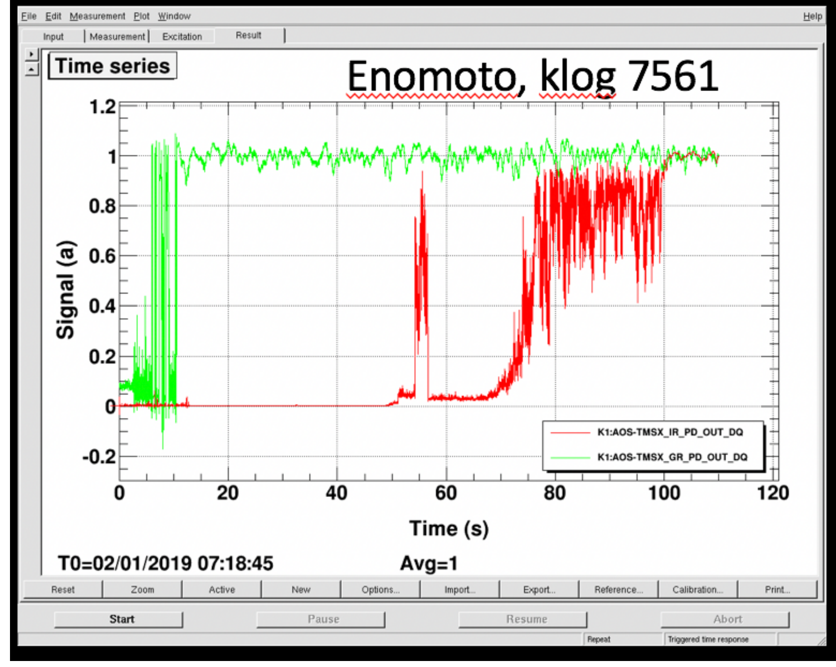
Calibration pipelines are being constructed

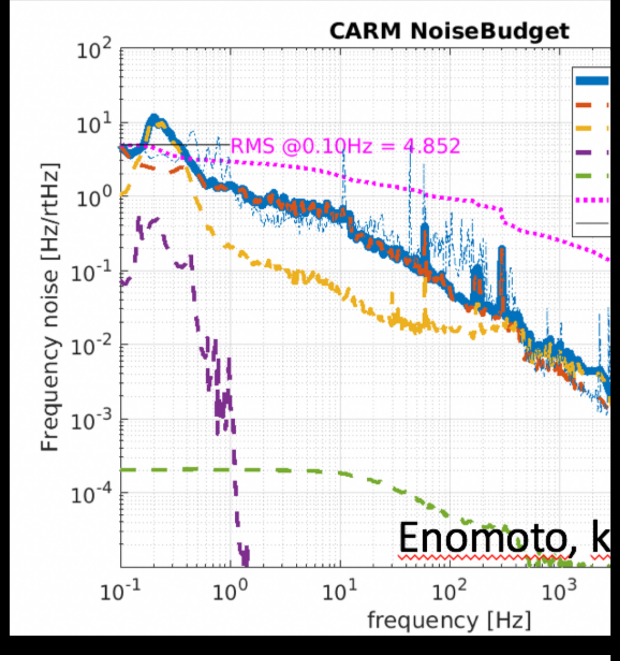
【Mirror】

Many mirrors were cleaned with FC before starting the DRMI commissioning.

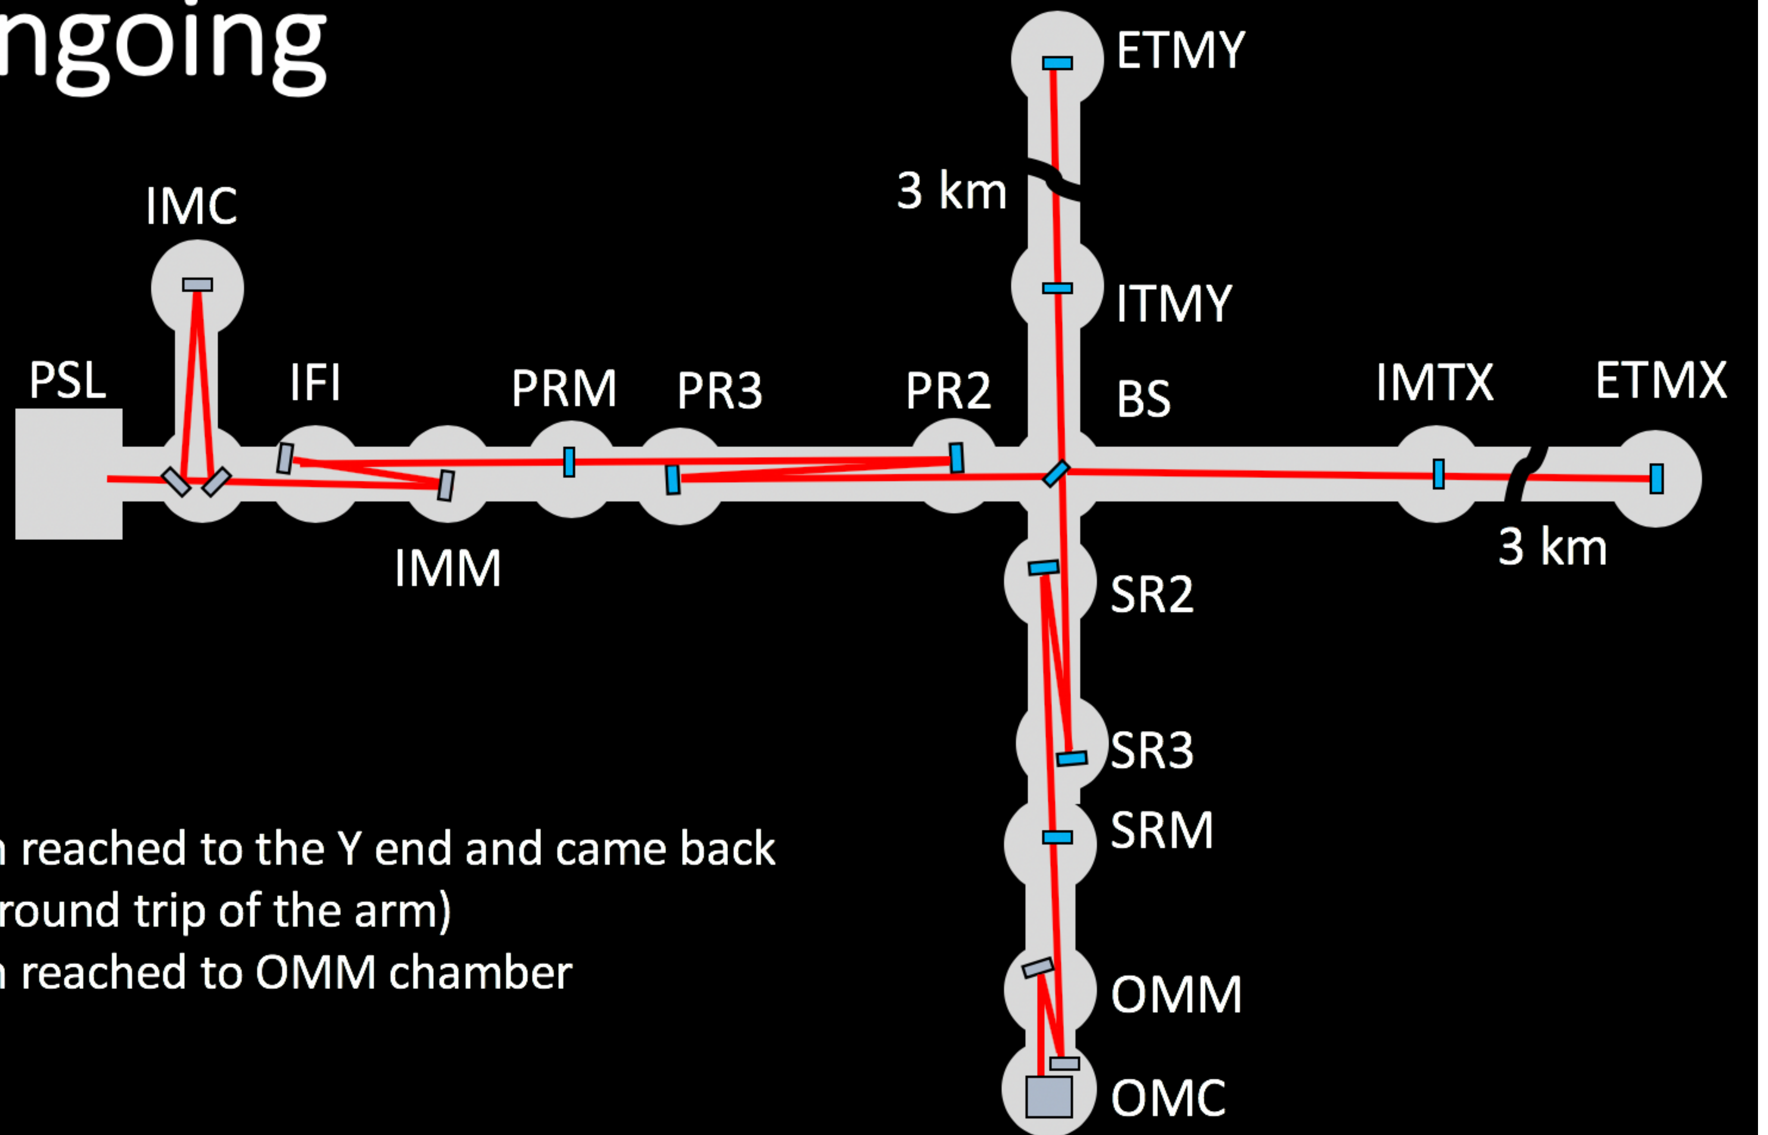
X-arm Locking Test

- X-arm test has completed
  - X-arm locked with the axillary (green) laser, then successfully handed off to the IR laser
  - Noise budgeting





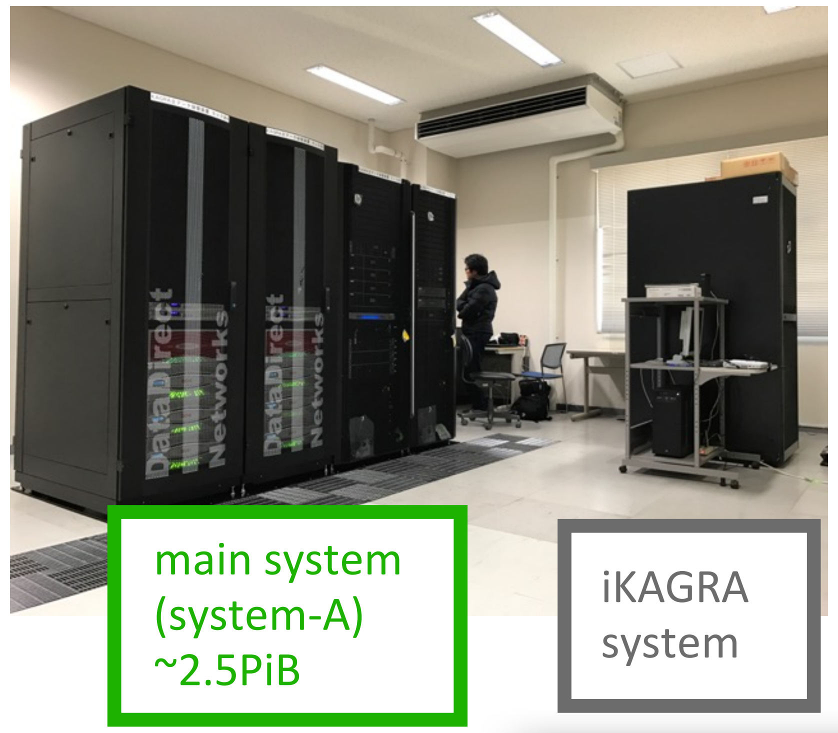
Interferometer Initial Alignment Ongoing

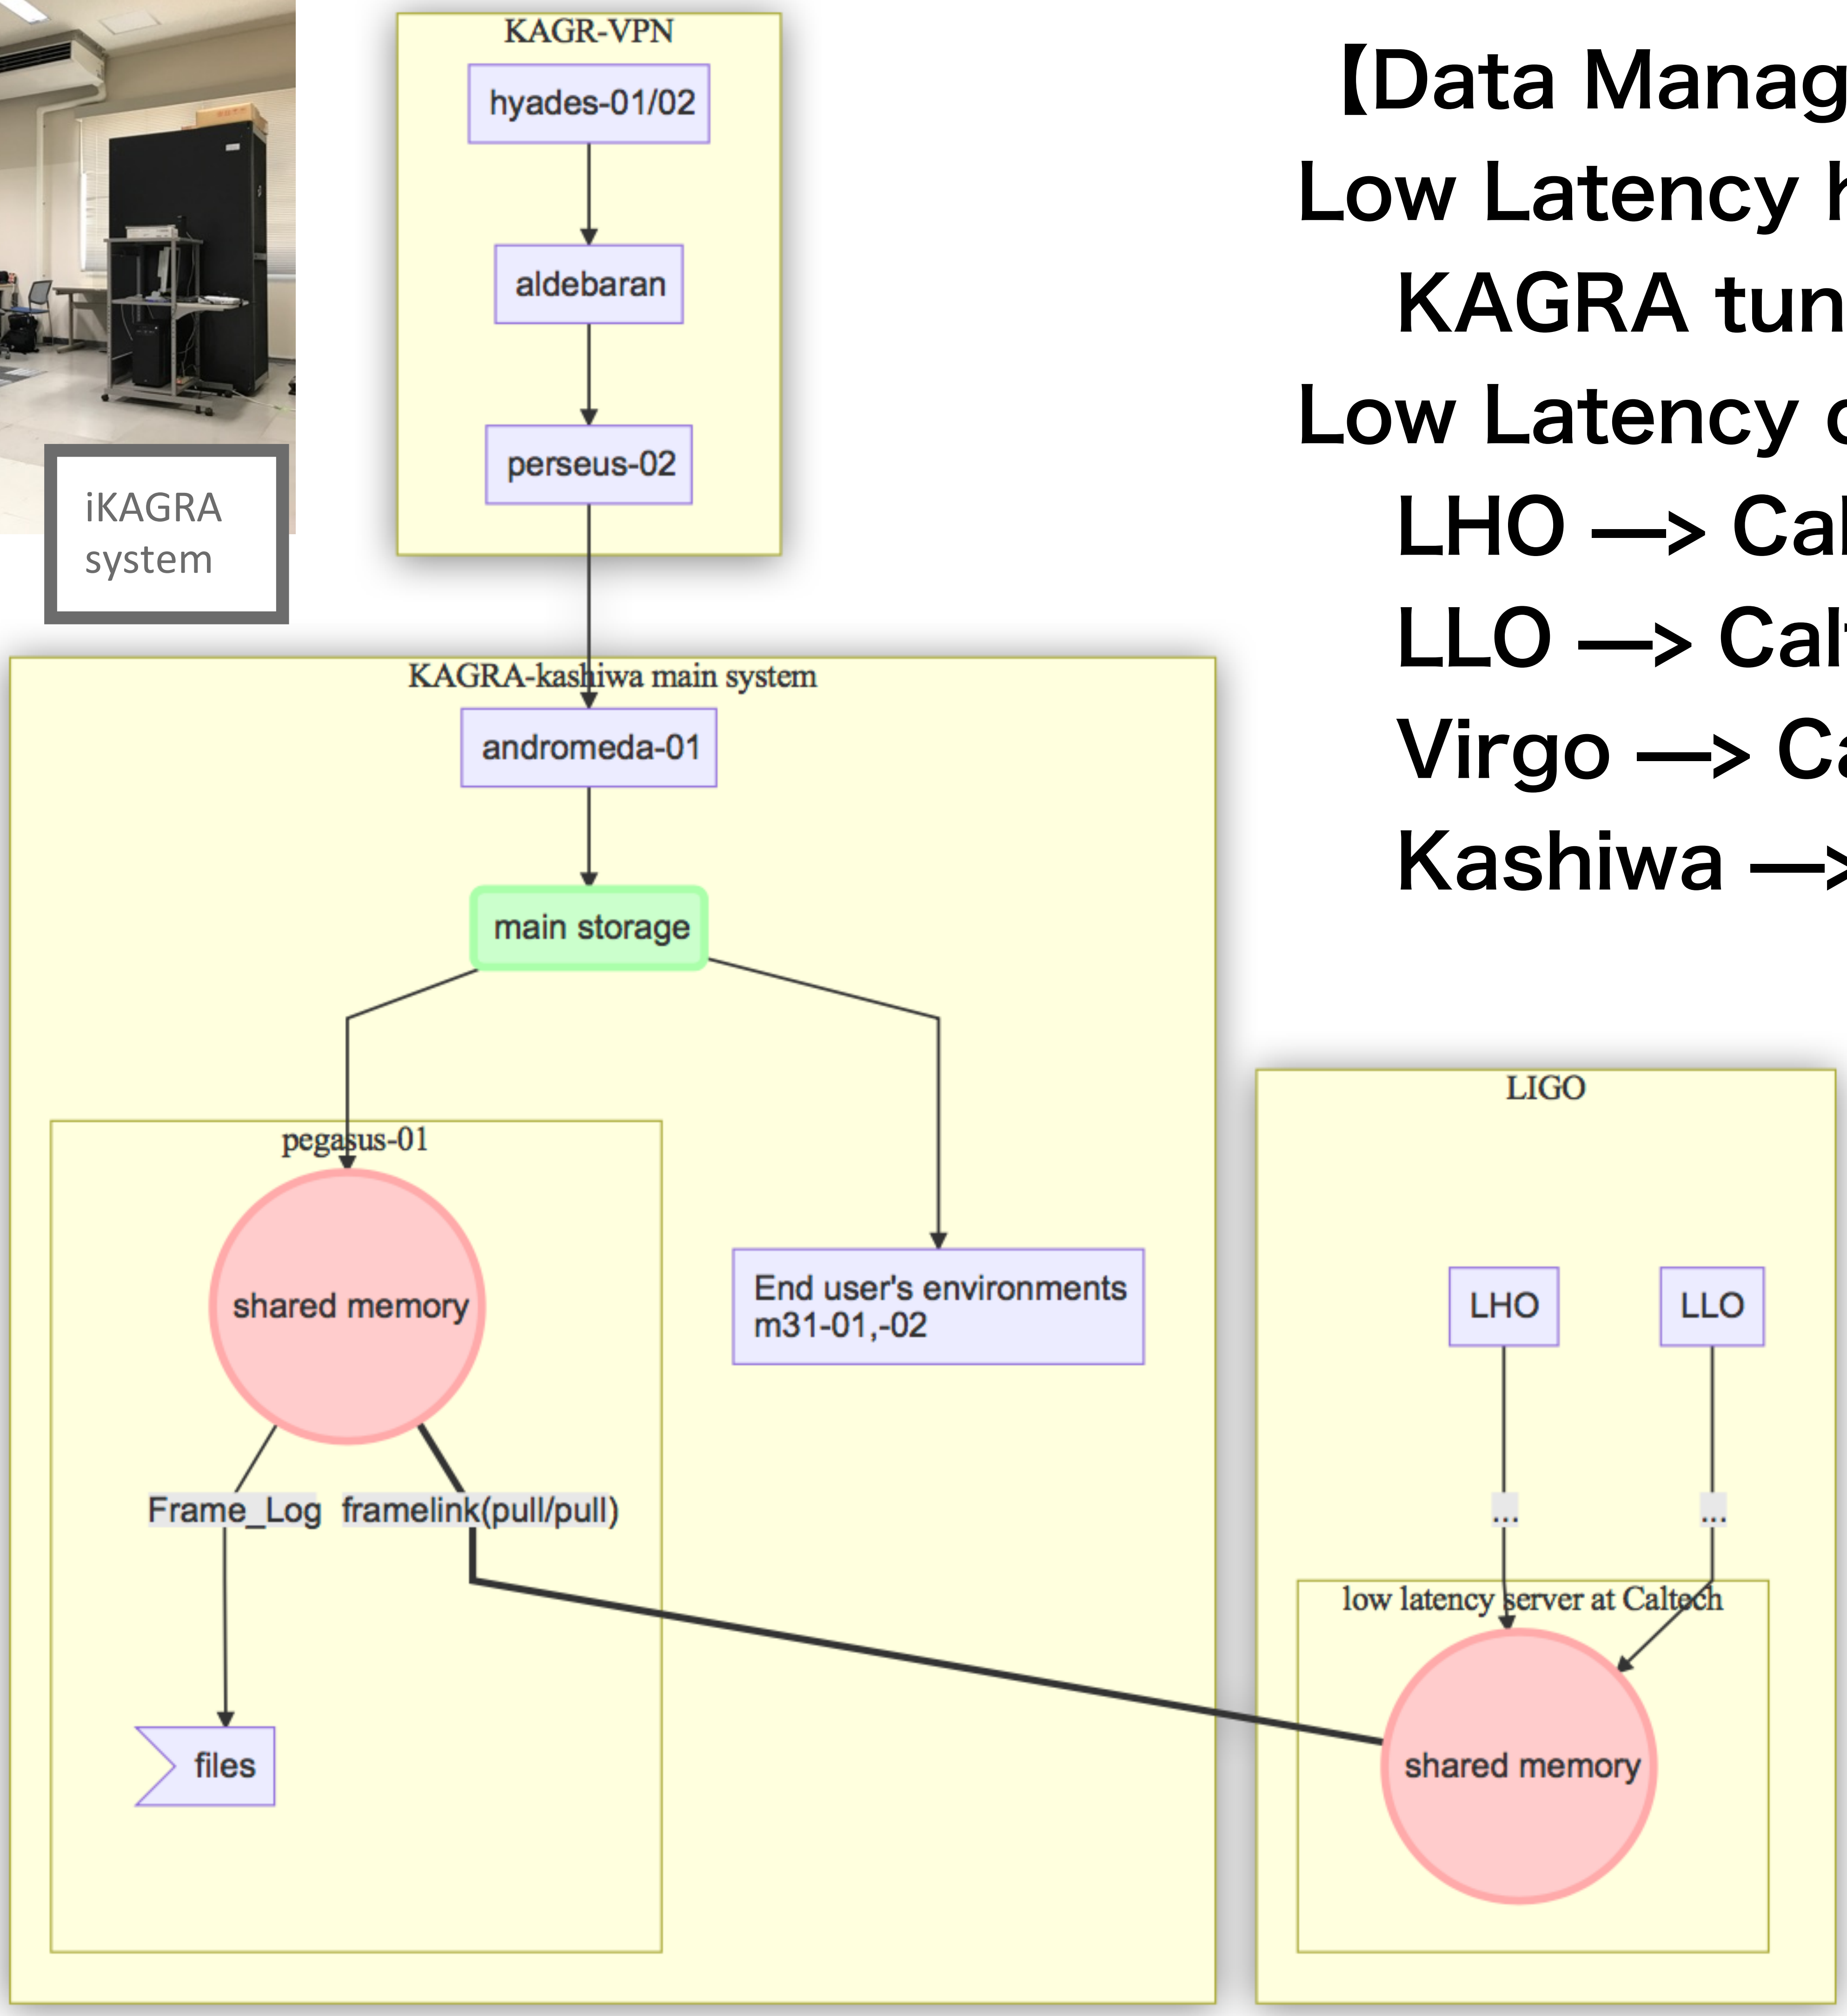


Beam reached to the Y end and came back
(one round trip of the arm)
Beam reached to OMM chamber

Data-exchange tests with low latency

KAGRA





【Data Management】

Low Latency h(t) transfer

KAGRA tunnel —> the surface —> Kashiwa server : 1.3 sec

Low Latency connection with LV (in Feb. 2019)

LHO —> Caltech —> Kashiwa : 6.4 sec

LLO —> Caltech —> Kashiwa : 9.6 sec

Virgo —> Caltech —> Kashiwa : ? sec

Kashiwa —> Caltech: ? sec

◆ KAGRA-LV data exchange will start in April.

(MOU between K-LV 2012, attachment B)

For KAGRA members, LV data access account will be issued only whom filed his/her signed "**O3 commitment form**" and applied for. (declare ethical statement on confidential issues).

Roadmap to join O3: Plan A & B

Jan 6: X-arm commissioning was finished.
Feb 11: Y-arm alignment was finished.
Feb 12-15: all the chambers in the central area were pump-downed.
Feb 18: DRMI commissioning (ITMs) was started
Feb 26: cool-down of ITMs was started

Mar 25: FPMI commissioning will be started.

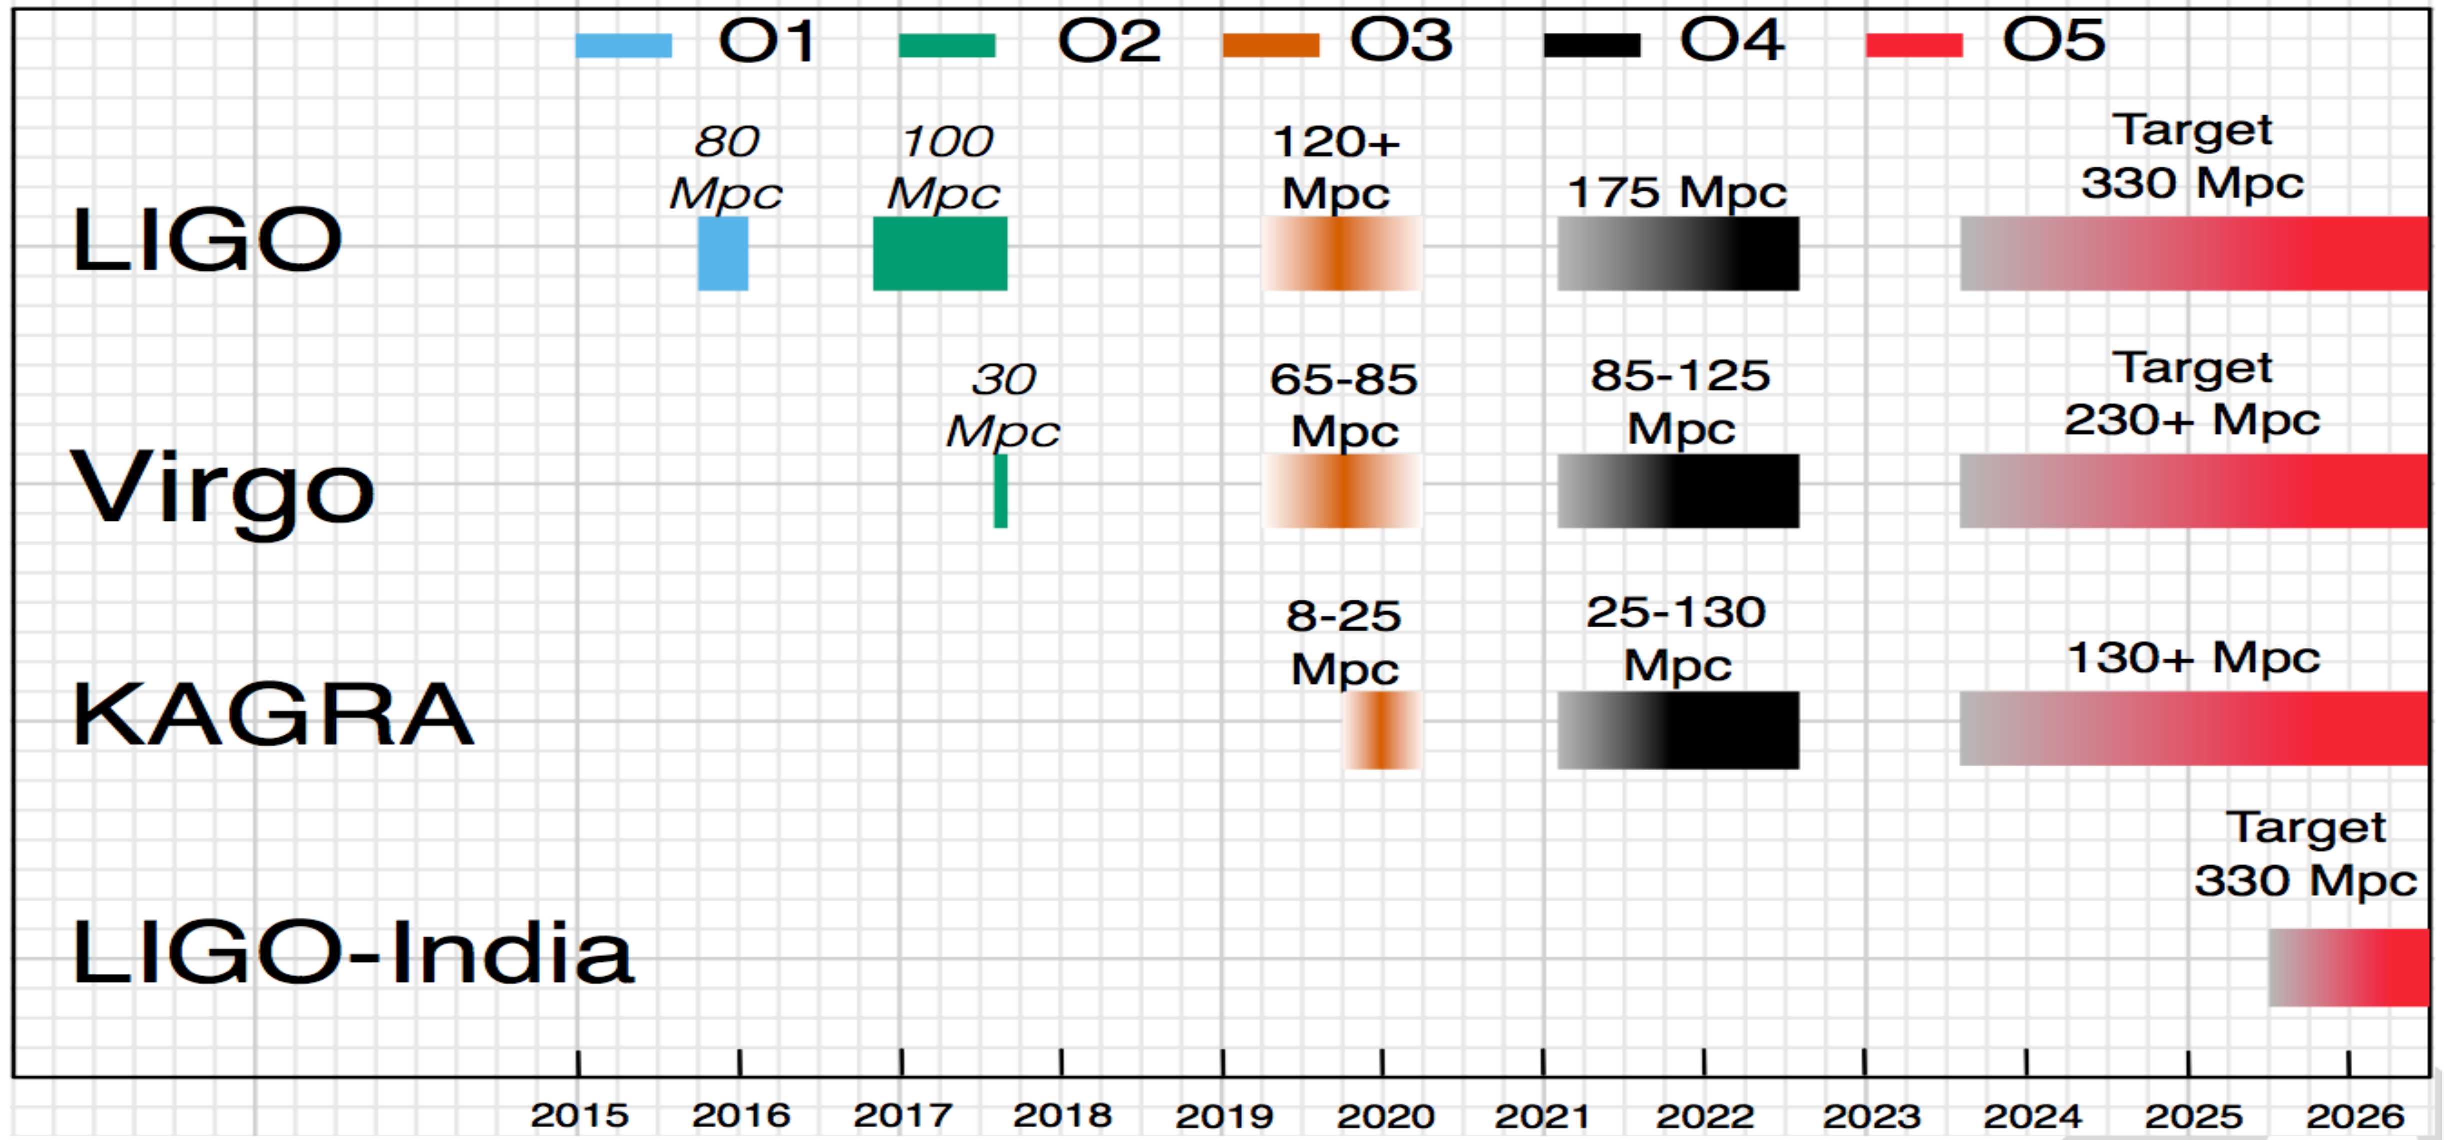
Status of KAGRA: Summary

KAGRA

- **Underground** and **Cryogenic** interferometric gravitational-wave detector at Kamioka, Japan
- KAGRA will finish all the installations by middle of April, 2019. (at least2-week delay from the plan a year ago).
- Our test run begins in early June.
- **KAGRA plans to join Observation Run 3 from fall 2019.**



- KAGRA-LV data exchange will start in April.
- KAGRA-LV MOU discussion will be started soon.
- KAGRA members are waiting to have access to LV wiki.
- KAGRA plans to join O4 from the beginning.
