JGW-G2415980
33rd KAGRA Face-to-Face Meeting Aug 2024

August 23, 2024

Future Strategy for KAGRA

Yuta Michimura
RESCEU, UTokyo
michimura@resceu.s.u-tokyo.ac.jp

(Moved from Caltech in April 2024)

Future Strategy Committee

- FSC's goal is (i) to make a suggestion of a concrete plan for KAGRA+ and beyond, and (ii) to recommend technologies that are to be implemented to KAGRA
  https://gwwiki.icrr.u-tokyo.ac.jp/JGWwiki/KAGRA/KSC/FSC
- Chairs changed in May 2024

  Masaki Ando (Chair)
  Sadakazu Haino (co-chair)
  Somiya Kentaro (co-chair)

  Yuta Michimura (Chair)
  Sadakazu Haino (co-chair)
  Somiya Kentaro (co-chair)
  Atsushi Nishizawa (co-chair)
- White paper writing team (chaired by S. Haino) is dissolved, but now whole FSC will take care
- Project R&D Committee (PRDC; chaired by K. Somiya) is still managed by FSC

Welcome to join FSC

- We welcome anyone interested to join FSC
  Just email me at michimura@resceu.s.u-tokyo.ac.jp
- Current members:

Masaki Ando
Rishabh Bajpai
Hong-Bo Jin
Ray-Kuang Lee
Matteo Leonardi
Ettore Majorana
Quynh Lan Nguyen
Micheal Page
Surojit Saha
Shalika Singh
Lijing Shao
Haoyu Wang
Kazuhiro Yamamoto
Takaaki Yokozawa

Instrument Science White Paper

- 2019 version (JGW-M1909590) was summarized as following papers, but we failed to update since
  Y. Michimura+, PRD 102, 022008 (2020) (instrument part)
  KAGRA Collab., PTEP 2021, 05A103 (2021) (science part)
- 2024 is a year to turn over a new leaf
- Overleaf link:
  https://www.overleaf.com/6619811679sbdjbqnrpxdm#bb456b
- We will focus on instrument, and plan to update yearly by Dec F2F
- Science part is updated yearly as LVK Observational Science White Paper

White Paper Structure

- Executive Summary (to be written by Dec 2024)
  - Summary of feasibility and relevance for each tech.
  - Summary of good upgrade candidates
- Introduction (written)
  - Background and the scope
- Survey of Current Technologies (to be written by Oct 2024)
  - Review of technologies relevant to KAGRA upgrade
  - Authors are (tentatively) assigned to most of items
  - Any ideas on **new technologies** missing and **volunteers to write** are highly welcomed
- Possible Upgrade Plans (to be written by Dec 2024)
  - Example upgrade plans that can be achieved by combining these technologies

List of Technologies for Survey

Light sources
- High power laser
- Use of different wavelengths
- Multi-carrier injection
- Frequency-independent squeezing
- Frequency-dependent squeezing

Test masses and coatings
- Birefringence reduction
- Large beam
- Large sapphire mass
- Use of different materials for test mass
- 120K Silicon
- Composite mass
- Parametric instability mitigation
- Thermal compensation system
- Use of different materials for coatings
- Non-TEM00 beam
- Non-cylindrical mass
- Khalili cavity
- Gratings

Cryogenic suspensions
- Sapphire blade spring improvement
- Use of ribbons
- Use of long fibers
- High conductivity fibers

Other optics
- Large beamsplitter
- Low-loss Faraday isolator
- Low-loss OMC
- Low-loss PD

Calibration
- Multi-color calibration

Low frequency noise reduction systems
- Seismic noise reduction
- Suspension point interferometer
- Newtonian noise cancellation
- Environmental magnetic noise sensors
- Charge noise reduction
- Instrumental baffles

Advanced classical control systems
- Phase camera
- Machine learning
- Laser induced desorption
- Quantum locking

Quantum control systems
- Homodyne readout
- Variational readout
- Optical spring
- Long-SRC
- Quantum expander
- Intracavity OPA
- White-light cavity
- PT symmetry
- Kerr amplification
- EPR squeezing
- Quantum teleportation
- Negative inertia

Alternative topologies
- Speed-meter
- Acceleration-meter
- Detuned speed-meter
- Delay line
- Local readout
- Single-photon detector
- Displacement noise free interferometer
- L resonator

Example of Survey Text

3.8.4 Long-SRC

Version history: First version in 2019 by K. Somiya; Updated in July 2024 by K. Somiya

Feasibility: 3 (Demonstrated by K. Komori in 2024)

A delay line in the signal-recycling cavity (SRC) generates a phase shift on the signal sideband and the signal response improves at around a certain frequency.

Example spectra are shown in Fig. 1. With $\ell = 100\,\mathrm{m}$, the shot noise curve is different from the one with $\ell = 10\,\mathrm{m}$, showing a gentle dip at around 3 kHz. With $\ell = 300\,\mathrm{m}$, the dip frequency comes lower to 2 kHz. Since there is no asymmetry in the upper and lower signal sidebands, the squeezing angle does not rotate at around the dip frequency. Thus, unlike the squeezing of a detuned interferometer, a simple frequency independent squeezing is good enough to obtain a gain in broadband frequencies around the dip frequency.

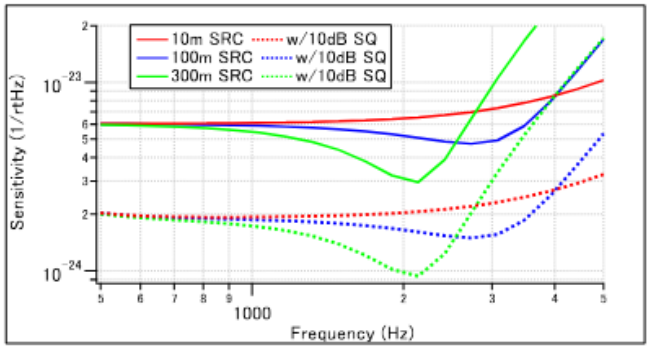

Figure 1: Sensitivity curve of KAGRA with a long signal recycling cavity and frequency-independent squeezing.

This is an attractive option for KAGRA+. One question is how to build a 300 m recycling cavity in the current facility. Actually the signal recycling cavity length in KAGRA is as long as 66 m for extending the cavity with two folding mirrors (SR2/SR3). We need to, however, use some part of the arm cavity vacuums to extend it to 300 m.

Name of the technology

Version history to keep track of when/who updated the text

Feasibility score and short justification
0: Idea phase
1: Theoretically well studied
2: Demonstration experiment on going
3: Demonstrated with a table-top experiment
4: Demonstrated with a prototype experiment (e.g. TAMA)
5: Demonstrated with one of LVK detectors

Copy text from previous version (2019) and updated part will be in red. Summarize in 3-4 paragraphs.

Plot if you have (usually not necessary)

White Paper Writing Workshop

- Dates: October 2-3, 2024
  Venue: Hiroshima University
  https://gwwiki.icrr.u-tokyo.ac.jp/JGWwiki/KAGRA/KSC/FSC/WWW2024
- Authors of white paper are invited

ASPIRE

FWG 4th Open Meeting

- Future Working Group (FWG) is open to anyone interested in new ideas
  https://gwwiki.icrr.u-tokyo.ac.jp/JGWwiki/KAGRA/KSC/FSC/FWG
- You can be a member just by sending an email to kagra-fwg-ctl@icrr.u-tokyo.ac.jp with "subscribe (YOUR NAME)" in the main body

- Planning to have a FWG 4th Open Meeting in Dec 2024, as a satellite meeting of F2F

Schedule

- **Oct 2-3, 2024**: White paper Writing Workshop
- **Dec 16-18, 2024**: KAGRA F2F
  - FWG 4th Open Meeting
  - Release of White Paper 2024
- **Feb-Apr 2025**: Call for Project R&D
  - White Paper will be used to evaluate
- **Apr-June 2025**: Application for KAKENHI grants
  - Hopefully the White Paper will be useful for applying to Tokusui, Kiban S etc., with more common agreement among collaborators

- **Dec 2025**: Release of White Paper 2025 …

Summary

- KAGRA Instrument Science White Paper 2024 is being written
- Any comments and volunteers are welcomed
- Welcome to join FSC or FWG

Additional Slides

Instrument Science White Paper Session

- Date: Aug 22 **15:00-17:30**
- Venue: **73C** (3rd floor of this TCU Building 7)

Scope of FSC

- White paper writing
- Organizing Project R&D and Advanced R&D
- Coordination of Future Working Group Open Meetings
- Responsible for future discussions within KAGRA
- Responsible for future discussions in JGWC, CRC meetings etc.
- Responsible for discussions of 2.5-3Gs in LVK meetings, IGWN etc.

Conceptual Flow of KAGRA Upgrade
